Abstract. Let $G$ be a finite group and $\pi_e(G)$ be the set of orders of all elements in $G$. The set $\pi_e(G)$ determines the prime graph (or Grunberg-Kegel graph) $\Gamma(G)$ whose vertex set is $\pi(G)$. The set of primes dividing the order of $G$, and two vertices $p$ and $q$ are adjacent if and only if $pq \in \pi_e(G)$. The degree $deg(p)$ of a vertex $p \in \pi(G)$, is the number of edges incident on $p$. Let $\pi(G) = \{p_1, p_2, ..., p_k\}$ with $p_1 < p_2 < ... < p_k$. We define $D(G) := (deg(p_1), deg(p_2), ..., deg(p_k))$, which is called the degree pattern of $G$. The group $G$ is called $k$-fold OD-characterizable if there exist exactly $k$ non-isomorphic groups $M$ satisfying conditions $|G| = |M|$ and $D(G) = D(M)$. Usually a 1-fold OD-characterizable group is simply called OD-characterizable. In this paper, we classify all finite groups with the same order and degree pattern as an almost simple groups related to $D_4(4)$.

Keywords: Degree pattern, $k$-fold OD-characterizable, Almost simple group.

1. Introduction

Let \( G \) be a finite group, \( \pi(G) \) the set of all prime divisors of \( |G| \) and \( \pi_n(G) \) be the set of orders of elements in \( G \). The prime graph (or Grunberg-Kegel graph) \( \Gamma(G) \) of \( G \) is a simple graph with vertex set \( \pi(G) \) in which two vertices \( p \) and \( q \) are joined by an edge (and we write \( p \sim q \)) if and only if \( G \) contains an element of order \( pq \) (i.e. \( pq \in \pi_n(G) \)).

The degree \( \text{deg}(p) \) of a vertex \( p \in \pi(G) \) is the number of edges incident on \( p \). If \( \pi(G) = \{p_1, p_2, ..., p_k\} \) with \( p_1 < p_2 < ... < p_k \), then we define \( D(G) := (\text{deg}(p_1), \text{deg}(p_2), ..., \text{deg}(p_k)) \), which is called the degree pattern of \( G \), and leads to the following definition.

**Definition 1.1.** The finite group \( G \) is called \( k \)-fold OD-characterizable if there exist exactly \( k \) non-isomorphic groups \( H \) satisfying conditions \( |G| = |H| \) and \( D(G) = D(H) \). In particular, a 1-fold OD-characterizable group is simply called OD-characterizable.

The interest in characterizing finite groups by their degree patterns started in [7] by M. R. Darafsheh and et. all, in which the authors proved that the following simple groups are uniquely determined by their order and degree patterns: All sporadic simple groups, the alternating groups \( A_p \) with \( p \) and \( p - 2 \) primes and some simple groups of Lie type. Also in a series of articles (see [4, 6, 8, 9, 14, 17]), it was shown that many finite simple groups are OD-characterizable.

Let \( A \) and \( B \) be two groups then a split extension is denoted by \( A : B \). If \( L \) is a finite simple group and \( \text{Aut}(L) \cong L : A \), then if \( B \) is a cyclic subgroup of \( A \) of order \( n \) we will write \( L : n \) for the split extension \( L : B \). Moreover if there are more than one subgroup of orders \( n \) in \( A \), then we will denote them by \( L : n_1, L : n_2, \) etc.

**Definition 1.2.** A group \( G \) is said to be an almost simple group related to \( S \) if and only if \( S \leq G \leq \text{Aut}(S) \), for some non-abelian simple group \( S \).

In many papers (see [2, 3, 10, 13, 15, 16]), it has been proved, up to now, that many finite almost simple groups are OD-characterizable or \( k \)-fold OD-characterizable for certain \( k \geq 2 \).

We denote the socle of \( G \) by \( \text{Soc}(G) \), which is the subgroup generated by the set of all minimal normal subgroups of \( G \). For \( p \in \pi(G) \), we denote by \( G_p \) and \( \text{Syl}_p(G) \) a Sylow \( p \)-subgroup of \( G \) and the set of all Sylow \( p \)-subgroups of \( G \) respectively, all further unexplained notation are standard and can be found in [11].

In this article our main aim is to show the recognizability of the almost simple groups related to \( L := D_4(4) \) by degree pattern in the prime graph and
order of the group. In fact, we will prove the following theorem.

**Main Theorem** Let $M$ be an almost simple group related to $L := D_4(4)$. If $G$ is a finite group such that $D(G) = D(M)$ and $|G| = |M|$, then the following assertions hold:

(a) If $M = L$, then $G \cong L$.
(b) If $M = L : 2_1$, then $G \cong L : 2_1$ or $L : 2_3$.
(c) If $M = L : 2_2$, then $G \cong L : 2_2$ or $Z_2 \times L$.
(d) If $M = L : 2_3$, then $G \cong L : 2_3$ or $L : 2_1$.
(e) If $M = L : 3$, then $G \cong L : 3$ or $Z_3 \times L$.
(f) If $M = L : 2^2$, then $G \cong L : 2^2$, $Z_2 \times (L : 2_1)$, $Z_2 \times (L : 2_2)$, $Z_2 \times (L : 2_3)$, $Z_4 \times L$ or $(Z_2 \times Z_2) \times L$.
(g) If $M = L : (D_6)_1$, then $G \cong L : (D_6)_1$, $L : 6$, $Z_3 \times (L : 2_1)$, $Z_3 \times (L : 2_3)$ or $(Z_3 \times L).Z_2$.
(h) If $M = L : (D_6)_2$, then $G \cong L : (D_6)_2$, $Z_2 \times (L : 3)$, $Z_3 \times (L : 2_2)$, $(Z_3 \times L).Z_2$, $Z_6 \times L$ or $D_6 \times L$.
(i) If $M = L : 6$, then $G \cong L : 6$, $L : (D_6)_1$, $Z_3 \times (L : 2_1)$, $Z_3 \times (L : 2_3)$ or $(Z_3 \times L).Z_2$.
(j) If $M = L : D_{12}$, then $G \cong L : D_{12}$, $Z_2 \times (L : (D_6)_1)$, $Z_2 \times (L : (D_6)_2)$, $Z_2 \times (L : 6)$, $Z_3 \times (L : 2^2)$, $(Z_3 \times (L : 2_1)).Z_2$, $(Z_3 \times (L : 2_2)).Z_2$, $(Z_3 \times (L : 2_3)).Z_2$, $Z_4 \times (L : 3)$, $(Z_2 \times Z_2) \times (L : 3)$, $(Z_4 \times L).Z_3$, $(Z_2 \times Z_2) \times L)$, $Z_3$, $Z_6 \times (L : 2_1)$, $Z_6 \times (L : 2_2)$, $Z_6 \times (L : 2_3)$, $(Z_6 \times L).Z_2$, $D_6 \times (L : 2_1)$, $D_6 \times (L : 2_2)$, $D_6 \times (L : 2_3)$, $Z_{12} \times L$, $(Z_2 \times Z_6) \times L$, $(Z_2 \times L).D_6$, $A_4 \times L$, $L.A_4$, $D_{12} \times L$ or $T \times L$.

2. Preliminary Results

It is well-known that Aut($D_4(4)$) $\cong D_4(4) : D_{12}$ where $D_{12}$ denotes the dihedral group of order 12. We remark that $D_{12}$ has the following non-trivial proper subgroups up to conjugacy: three subgroups of order 2, one cyclic subgroup each of order 3 and 6, two subgroups isomorphic to $D_6 \cong S_3$ and one subgroup of order 4 isomorphic to the Klein's four group denoted by $2^2$. The field and the duality automorphisms of $D_4(4)$ are denoted by $2_1$ and $2_2$ respectively, and we set $2_3 = 2_1.2_2$ (field+duality which is called the diagonal automorphism). Therefore up to conjugacy we have the following almost simple groups related to $D_4(4)$.

**Lemma 2.1.** If $G$ is an almost simple group related to $L := D_4(4)$, then $G$ is isomorphic to one of the following groups: $L, L : 2_1, L : 2_2, L : 2_3, L : 3, L : 2^2, L : (D_6)_1, L : (D_6)_2, L : 6, L : D_{12}$.

**Lemma 2.2** ([5]). Let $G$ be a Frobenius group with kernel $K$ and complement $H$. Then:

(a) $K$ is a nilpotent group.
(b) $|K| \equiv 1(\text{mod}|H|)$. 

Let $p \geq 5$ be a prime. We denote by $\mathcal{S}_p$, the set of all simple groups with prime divisors at most $p$. Clearly, if $q \leq p$, then $\mathcal{S}_q \subseteq \mathcal{S}_p$. We list all the simple groups in class $\mathcal{S}_{17}$ with their order and the order of their outer automorphisms in TABLE 1, taken from [12].

**TABLE 1**: Simple groups in $\mathcal{S}_p$, $p \leq 17$.

Definition 2.3. A completely reducible group will be called a CR-group. The center of a CR-group is a direct product of the abelian factor in the decomposition. Hence, a CR-group is centerless, that is, has trivial center, if and only if it is a direct product of non-abelian simple groups. The following Lemma determines the structure of the automorphism group of a centerless CR-group.

Lemma 2.3 ([11]). Let \( R \) be a finite centerless CR-group and write \( R = R_1 \times R_2 \times \ldots \times R_k \), where \( R_i \) is a direct product of \( n_i \) isomorphic copies of a simple group \( H_i \), and \( H_i \) and \( H_j \) are not isomorphic if \( i \neq j \). Then \( \text{Aut}(R) = \text{Aut}(R_1) \times \text{Aut}(R_2) \times \ldots \times \text{Aut}(R_k) \cong \text{Aut}(H_i) \wr \mathbb{S}_{n_i} \), where in this wreath product \( \text{Aut}(H_i) \) appears in its right regular representation and the symmetric group \( \mathbb{S}_{n_i} \) in its natural permutation representation. Moreover, these isomorphisms induce isomorphisms \( \text{Out}(R) \cong \text{Out}(R_1) \times \text{Out}(R_2) \times \ldots \times \text{Out}(R_k) \cong \text{Out}(H_i) \wr \mathbb{S}_{n_i} \).

3. OD-Characterization of Almost Simple Groups Related to \( D_4(4) \)

In this section, we study the problem of characterizing almost simple groups by order and degree pattern. Especially we will focus our attention on almost simple groups related to \( L = D_4(4) \), namely, we will prove the Main Theorem of Sec. 1. We break the proof into a number of separate propositions.

By assumption, we depict all possibilities for the prime graph associated with \( G \) by use of the variables for some vertices in each proposition. Also, we need to know the structure of \( \Gamma(M) \) to determine the possibilities for \( G \) in some proposition, therefore we depict the prime graph of all extension of \( L \) in pages 18 to 20. Note that the set of order elements in each of the following propositions is calculated using Magma.

Proposition 3.1. If \( M = L \), then \( G \cong L \).

Proof. By TABLE 1 \( |L| = 2^{24} \cdot 3^5 \cdot 5^4 \cdot 7 \cdot 13 \cdot 17^2 \). \( \pi_e(L) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 15, 17, 20, 21, 30, 34, 51, 63, 65, 85, 255\} \), so \( D(L) = \{3, 4, 4, 1, 1, 3\} \). Since \( |G| = |L| \) and \( D(G) = D(L) \), we conclude that the prime graph of \( G \) has following form:

![Figure 3.1](image-url)
We will show that $G$ is isomorphic to $L = D_4(4)$. We break up the proof into several steps.

**Step 1.** Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2,3,5\}$-group. In particular, $G$ is non-solvable.

First we show that $K$ is a $17'$-group. Assume the contrary and let $17 \in \pi(K)$. Then 13 dose not divide the order of $K$. Otherwise, we may suppose that $T$ is a Hall $\{13,17\}$-subgroup of $K$. It is seen that $T$ is a nilpotent subgroup of order $13.17^i$ for $i = 1$ or 2. Thus, $13.17 \in \pi_e(K) \subseteq \pi_e(G)$, a contradiction. Thus $\{17\} \subseteq \pi(K) \subseteq \pi(G) - \{13\}$. Let $K_{17} \in \text{Syl}_{17}(K)$. By Frattini argument, $G = KN_G(K_{17})$. Therefore, $N_G(K_{17})$ contains an element $x$ of order 13. Since $G$ has no element of order $13.17$, ($x$) should act fixed point freely on $K_{17}$, that is implying $\langle x \rangle K_{17}$ is a Frobenius group. By Lemma 2.2(b), $|\langle x \rangle ||(|K_{17}| - 1)$. It follows that $13|17^i - 1$ for $i = 1$ or 2, which is a contradiction.

Next, we show that $K$ is a $p'$-group for $p \in \{a,b\}$. Let $p||K|$ and $K_p \in \text{Syl}_p(K)$. Now by Frattini argument, $G = KN_G(K_p)$, so 17 must divide the order of $N_G(K_p)$. Therefore, the normalizer $N_G(K_p)$ contains an element of order 17, say $x$. So $\langle x \rangle K_p$ is a cyclic subgroup of $G$ of order 17$p$, and so $p \sim 17$ in $\Gamma(G)$, which is a contradiction. Therefore $K$ is a $\{2,3,5\}$-group. In addition, since $K$ is a proper subgroup of $G$, it follows that $G$ is non-solvable.

**Step 2.** The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group isomorphic to $L := D_4(4)$.

Let $\overline{G} = G/K$. Then $S := \text{Soc}(\overline{G}) = P_1 \times P_2 \times ... \times P_m$, where $P_i$s are finite non-abelian simple groups and $S \leq \overline{G} \leq \text{Aut}(S)$. If we show that $m = 1$, the proof of Step 2 will be completed.

Suppose that $m \geq 2$. In this case, we claim that 13 does not divide $|S|$. Assume the contrary and let $13 \mid |S|$, on the other hand, $\{2,3\} \subset \pi(P_i)$ for every $i$ (by TABLE 1), hence $2 \sim 13$ and $3 \sim 13$, which is a contradiction.

Now, by step 1, we observe that $13 \in \pi_e(\overline{G}) \subseteq \pi_e(\text{Aut}(S))$. But $\text{Aut}(S) = \text{Aut}(S_1) \times \text{Aut}(S_2) \times ... \times \text{Aut}(S_t)$, where the groups $S_j$ are direct products of isomorphic $P_i$s such that $S = S_1 \times S_2 \times ... \times S_t$. Therefore, for some $j$, 13 divides the order of an automorphism group of a direct product $S_j$ of $t$ isomorphic simple groups $P_i$. Since $P_i \in \mathcal{S}_{17}$, it follows that $|\text{Out}(P_i)|$ is not divisible by 13 (see TABLE 1). Now, by Lemma 2.3, we obtain $|\text{Aut}(S_j)| = |\text{Aut}(P_i)|^{t_i}t_i!$. Therefore, $t \geq 13$ and so $2^{26}$ must divide the order of $G$, which is a contradiction. Therefore $m = 1$ and $S = P_i$.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha.3^\beta.5^\gamma.7.13.17^2$, where $2 \leq \alpha \leq 24$, $1 \leq \beta \leq 5$ and $0 \leq \gamma \leq 4$. Now, using collected results contained in TABLE 1, we deduce that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$ is completed. As $|G| = |L|$, we deduce $K = 1$, so $G \cong L$ and the proof is completed.
Proposition 3.2. If $M = L:2_1$, then $G \cong L:2_1$ or $L:2_3$.

Proof. As $|L:2_1| = 2^{25}3^55^47.13.17^2$ and $\pi_e(L:2_1) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 40, 42, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}$, then $D(L:2_1) = (4, 4, 2, 1, 3)$. Since $|G| = |L:2_1|$ and $D(G) = D(L:2_1)$, we conclude that there exist several possibilities for $\Gamma(G)$:

\[
\begin{array}{ccc}
7 & a & 17 \\
b & c & 13 \\
\end{array}
\]

where $\{a, b, c\} = \{2, 3, 5\}$.

Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

By a similar argument to that in Proposition 3.1, we can obtain this assertion.

Step 2. The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

The proof is similar to Step 2 of Proposition 3.1.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha 3^\beta 5^\gamma 7.13.17^2$, where $2 \leq \alpha \leq 25$, $1 \leq \beta \leq 5$ and $0 \leq \gamma \leq 4$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$. As $|G| = |L:2_1| = 2|L|$, we deduce $|K| = 1$ or 2.

If $|K| = 1$, then $G \cong L:2_1$, $L:2_2$ or $L:2_3$. Obviously, $G \cong L:2_1$ or $L:2_3$ because $\text{deg}(2) = 5$ in $\Gamma(L:2_2)$ (see page 16).

If $|K| = 2$, then $K \leq Z(G)$ and so $\text{deg}(2) = 5$, which is a contradiction. \(\square\)

Proposition 3.3. If $M = L:2_2$, then $G \cong L:2_2$ or $\mathbb{Z}_2 \times L$.

Proof. As $|L:2_2| = 2^{25}3^55^47.13.17^2$ and $\pi_e(L:2_2) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 17, 18, 20, 21, 24, 30, 34, 40, 42, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}$, then $D(L:2_2) = (5, 4, 4, 2, 2, 3)$. By assumption $|G| = |L:2_2|$ and $D(G) = D(L:2_2)$, so the prime graph of $G$ has following form:

\[
\begin{array}{ccc}
3 & \\
5 & 2 \\
a & b & 17 \\
\end{array}
\]

where $\{a, b\} = \{7, 13\}$. 
Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

By similar arguments as in the proof of Step 1 in Proposition 3.1, we conclude that $K$ is a $\{2, 3, 5\}$-group and $G$ is non-solvable.

Step 2. The quotient $\frac{G}{K}$ is an almost simple group. In fact, $S \leq \frac{G}{K} \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

Let $G/K = \frac{G}{K}$. Then $S := \text{Soc}(G)$, $S = P_1 \times P_2 \times \ldots \times P_m$, where $P_i$'s are finite non-abelian simple groups and $S \leq \frac{G}{K} \leq \text{Aut}(S)$. We are going to prove that $m = 1$ and $S = P_1$. Suppose that $m \geq 2$. We claim $a$ does not divide $|S|$. Assume the contrary and let $a \mid |S|$, we conclude that a just divide the order of one of the simple groups $P_i$'s. Without loss of generality, we assume that $a \mid |P_1|$. Then the rest of the $P_i$'s must be $\{2, 3\}$-group (because only 2 and 3 are adjacent to a in $\Gamma(G)$), this is a contradiction because $P_i$'s are finite non-abelian simple groups. Now, by Step 1, we observe that $a \in \pi(G) \subseteq \pi(\text{Aut}(S))$. But $\text{Aut}(S) = \text{Aut}(S_1) \times \text{Aut}(S_2) \times \ldots \times \text{Aut}(S_r)$, where the groups $S_j$ are direct products of isomorphic $P_i$'s such that $S = S_1 \times S_2 \times \ldots \times S_r$. Therefore, for some $j$, $a$ divides the order of an automorphism group of a direct product $S_j$ of $t$ isomorphic simple groups $P_i$. Since $P_i \in \mathfrak{S}_7$, it follows that $|\text{Out}(P_i)|$ is not divisible by $a$ (see TABLE 1), so $a$ does not divide the order of $\text{Aut}(P_i)$. Now, by Lemma 2.3, we obtain $|\text{Aut}(S_j)| = |\text{Aut}(P_i)|^{t!}$. Therefore, $t \geq a$ and so $3^a$ must divide the order of $G$, which is a contradiction. Therefore $m = 1$ and $S = P_1$.

By TABLE 1 and Step 1, it is evident that $|S| = 2^a \cdot 3^b \cdot 5^c \cdot 7 \cdot 13 \cdot 17^2$, where $2 \leq a \leq 25$, $1 \leq b \leq 5$ and $0 \leq c \leq 4$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq \frac{G}{K} \leq \text{Aut}(L)$. As $|G| = |L : 2_2| = 2|L|$, we deduce $|K| = 1$ or $2$.

If $|K| = 1$, then $G \cong L : 2_1$, $L : 2_2$ or $L : 2_3$ because $|G| = 2|L|$. It is obvious that $G \cong L : 2_2$, because $deg(13) = 1$ in $\Gamma(L : 2_1)$ and $\Gamma(L : 2_2)$ (see page 17).

If $|K| = 2$, then $G/K \cong L$ and $K \leq Z(G)$. It follows that $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is 1. But this is a contradiction, so we obtain that $G$ split over $|K|$. Hence $G \cong Z_2 \times L$.

Proposition 3.4. If $M = L : 2_3$, then $G \cong L : 2_3$ or $L : 2_1$.

Proof. As $|L : 2_3| = 2^{25} \cdot 3^2 \cdot 5^4 \cdot 7 \cdot 13 \cdot 17^2$ and $\pi_r(L : 2_3) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 51, 63, 65, 85, 255\}$, then $D(L : 2_3) = (4, 4, 4, 2, 1, 3)$. Since $|G| = |L : 2_3|$ and $D(G) = D(L : 2_3)$, we conclude that $\Gamma(G)$ has the following form similarly to Proposition 3.2:
where \(\{a, b, c\} = \{2, 3, 5\}\).

**Step 1.** Let \(K\) be the maximal normal solvable subgroup of \(G\). Then \(K\) is a \(\{2, 3, 5\}\)-group. In particular, \(G\) is non-solvable.

We can prove this by the similar way to that in Proposition 3.2.

**Step 2.** The quotient \(G/K\) is an almost simple group. In fact, \(S \leq G/K \trianglelefteq \text{Aut}(S)\), where \(S\) is a finite non-abelian simple group.

By using a similar argument, as in the proof of Proposition 3.2, we can verify that \(G/K\) is an almost simple group.

By TABLE 1 and Step 1, it is evident that \(|S| = 2^\alpha 3^\beta 5^\gamma 7\cdot 13\cdot 17^2\), where \(2 \leq \alpha \leq 25, 1 \leq \beta \leq 5\) and \(0 \leq \gamma \leq 4\). Now, using collected results contained in TABLE 1, we conclude that \(S \cong D_4(4)\) and by Step 2, \(L \trianglelefteq G \trianglelefteq \text{Aut}(L)\). As \(|G| = |L : 2^3| = 2|L|\), we deduce \(|K| = 1\) or 2.

If \(|K| = 1\), then \(G \cong L : 2_1\), \(L : 2_2\) or \(L : 2_3\) because \(|G| = 2|L|\). Obviously, \(G \cong L : 2_3\) or \(L : 2_1\), because \(\text{deg}(2) = 5\) in \(\Gamma(L : 2_2)\) (see page 16).

If \(|K| = 2\), then \(K \leq Z(G)\) and so \(\text{deg}(2) = 5\), which is a contradiction. \(\Box\)

**Proposition 3.5.** If \(M = L : 3\), then \(G \cong L : 3\) or \(\mathbb{Z}_3 \times L\).

**Proof.** As \(|L : 3| = 2^{24} 3^6 5^4 7^{13} 13^{17} 2^2\) and \(\pi_e(L : 3) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 15, 17, 18, 20, 21, 24, 30, 34, 39, 45, 51, 63, 65, 85, 255\}\), then \(D(L : 3) = (3, 5, 4, 1, 2, 3)\). Since \(|G| = |L : 3|\) and \(D(G) = D(L : 3)\), we conclude that \(\Gamma(G)\) has the following form (like \(\Gamma(L : 3)\)):

![Figure 3.5](image-url)

**Step 1.** Let \(K\) be the maximal normal solvable subgroup of \(G\). Then \(K\) is a \(\{2, 3\}\)-group. In particular, \(G\) is non-solvable.

First, we show that \(K\) is a \(p\)-group for \(p = 7, 13\) and 17. Since the proof is quite similar to the proof of Step 1 in Proposition 3.1, so we avoid here full explanation of all details.
Next we consider $K$ is a $5'$-group. Assume the contrary, $5 \in \pi_e(K)$. Let $K_5 \in \text{Syl}_5(K)$. By Frattini argument, $G = KN_G(K_5)$. Therefore, $N_G(K_5)$ has an element $x$ of order 7. Since $G$ has no element of order 5, $\langle x \rangle$ should act fixed point freely on $K_5$, implying $\langle x \rangle K_5$ is a Frobenius group. By Lemma 2.2(b), $|\langle x \rangle||(K_5' - 1)$, which is impossible. Therefore $K$ is a $\{2,3\}$-group.

In addition since $K$ is a proper subgroup of $G$, then $G$ is non-solvable and the proof of this step is completed.

**Step 2.** The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \not\leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

In a similar way as in the proof of Step 2 in Proposition 3.1, we conclude that $G/K$ is an almost simple group.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha 3^3 5^4 7 13 17^2$, where $2 \leq \alpha \leq 24$ and $1 \leq \beta \leq 6$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \not\leq \text{Aut}(L)$. As $|G| = |L : 3| = 3|L|$, we deduce $|K| = 1$ or 3.

If $|K| = 1$, then $G \cong L : 3$.

If $|K| = 3$, then $G/K \cong L$. In this case we have $G/C_G(K) \not\leq \text{Aut}(K) \cong \mathbb{Z}_2$. Thus $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is 1. But this is a contradiction, so we obtain that $G$ split over $K$. Hence $G \cong \mathbb{Z}_3 \times L$. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$, which is a contradiction since $L$ is simple. \hfill \Box

**Proposition 3.6.** If $M = L : 2^2$, then $G \cong L : 2^2$, $\mathbb{Z}_2 \times (L : 2_1)$, $\mathbb{Z}_2 \times (L : 2_2)$, $\mathbb{Z}_2 \times (L : 2_3)$, $\mathbb{Z}_2 \times L$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L$.

**Proof.** As $|L : 2^2| = 2^{26} 3^5 5^4 7 13 17^2$ and $\pi_e(L : 2^2) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 26, 30, 34, 42, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}$, then $D(L : 2^2) = \langle 5, 4, 4, 2, 2, 3 \rangle$. Since $|G| = |L : 2^2|$ and $D(G) = D(L : 2^2)$, so the prime graph of $G$ has following form similarly to Proposition 3.3:

![Figure 3.6](image)

where $\{a, b\} = \{7, 13\}$. 
**Step 1.** Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

According to Step 1 in Proposition 3.3, we have $K$ is a $\{2, 3, 5\}$-group and $G$ is non-solvable.

**Step 2.** The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

We can prove this by the similar argument in Step 2 in Proposition 3.3.

By TABLE 1 and Step 1, it is evident that $|S| = 2^a.3^b.5^c.7.13.17^2$, where $2 \leq a \leq 26$, $1 \leq b \leq 5$ and $0 \leq c \leq 4$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$. As $|G| = |L: 2^2| = 4|L|$, we deduce $|K| = 1, 2$ or $4$.

If $|K| = 1$, then $G \cong L: 2^2$.

If $|K| = 2$, then $K \leq Z(G)$. In this case $G$ is a central extension of $\mathbb{Z}_2$ by $L: 2_1$, $L: 2_2$ or $L: 2_3$. If $G$ splits over $K$ then $G \cong \mathbb{Z}_2 \times (L: 2_1)$, $\mathbb{Z}_2 \times (L: 2_2)$ or $\mathbb{Z}_2 \times (L: 2_3)$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L: 2_1, L: 2_2$ and $L: 2_3$, which is impossible.

If $|K| = 4$, then $G/K \cong L$. In this case we have $G/C_G(K) \leq \text{Aut}(K) \cong \mathbb{Z}_2$ or $S_3$. Thus $|G/C_G(K)| = 1, 2, 3$ or $6$. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is 1, but this is a contradiction. Therefore $G$ splits over $K$. Hence $G \cong K \times L$. So we have $G \cong \mathbb{Z}_4 \times L$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L$ because $K \cong \mathbb{Z}_4$ or $\mathbb{Z}_2 \times \mathbb{Z}_2$. If $|G/C_G(K)| = 2, 3$ or $6$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$. Which is a contradiction, since $L$ is simple.

**Proposition 3.7.** If $M = L: (D_6)_1$, then $G \cong L: (D_6)_1$, $L: 6$, $\mathbb{Z}_3 \times (L: 2_1)$, $\mathbb{Z}_3 \times (L: 2_2)$ or $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$.

**Proof.** As $|L: (D_6)_1| = 2^{25}.3^6.5^4.7.13.17^2$ and $\pi_0(L: (D_6)_1) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 39, 42, 45, 51, 60, 63, 65, 85, 255\}$, then $D(L: (D_6)_1) = (4, 5, 4, 2, 2, 3)$. Since $|G| = |L: (D_6)_1|$ and $D(G) = D(L: (D_6)_1)$, we conclude that there exist several possibilities for $\Gamma(G)$:

![Figure 3.7](image-url)
where \( \{a, b\} = \{7, 13\} \).

**Step1.** Let \( K \) be the maximal normal solvable subgroup of \( G \). Then \( K \) is a \( \{2, 3, 5\} \)-group. In particular, \( G \) is non-solvable.

By the similar argument to that in Step 1 in Proposition 3.1, we can obtain this assertion.

**Step 2.** The quotient \( G/K \) is an almost simple group. In fact, \( S \leq G/K \leq \text{Aut}(S) \), where \( S \) is a finite non-abelian simple group. The proof is similar to Step 2 in Proposition 3.3.

By TABLE 1 and Step 1, it is evident that \( |S| = 2^a3^b5^c7^{13}17^2 \), where \( 2 \leq a \leq 25, 1 \leq b \leq 6, 0 \leq c \leq 4 \). Now, using collected results contained in TABLE 1, we conclude that \( S \cong D_{14}(4) \) and by Step 2, \( L \leq G/K \leq \text{Aut}(L) \). As \( |G| = |L : D_6\rangle_1| = 6|L| \), we deduce \( |K| = 1, 2, 3 \) or 6.

If \( |K| = 1 \), then \( G \cong L : (D_6\rangle_1, L : (D_6\rangle_2 \) or \( L : 6 \) because \( |G| = 6|L| \). Obviously, \( G \cong L : (D_6\rangle_1 \) or \( L : 6 \) because \( \text{deg}(2) = 5 \) in \( \Gamma(L : (D_6\rangle_2) \).

If \( |K| = 2 \), then \( K \leq Z(G) \) and so \( \text{deg}(2) = 5 \), which is a contradiction (see page 18).

If \( |K| = 3 \), then \( G/K \cong L : 2_1, L : 2_2 \) or \( L : 2_3 \). But \( G/C_G(K) \cong \text{Aut}(K) \cong \mathbb{Z}_2 \). Thus \( |G/C_G(K)| = 1 \) or 2. If \( |G/C_G(K)| = 1 \), then \( K \leq Z(G) \), that is, \( G \) is a central extension of \( K \) by \( L : 2_1, L : 2_2 \) or \( L : 2_3 \). If \( G \) splits over \( K \), then \( G \cong \mathbb{Z}_3 \times (L : 2_1) \) or \( \mathbb{Z}_3 \times (L : 2_2) \) because \( \Gamma(\mathbb{Z}_3 \times (L : 2_2)) \) the degree of 2 is 5. Otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L : 2_1, L : 2_2 \) and \( L : 2_3 \), which is impossible. If \( |G/C_G(K)| = 2 \), then \( K < C_G(K) \) and \( 1 \neq C_G(K)/K \leq G/K \cong L : 2_1, L : 2_2 \) or \( L : 2_3 \), we obtain \( C_G(K)/K \cong L \). Since \( K \leq Z(C_G(K)) \), \( C_G(K) \) is a central extension of \( K \) by \( L \). If \( C_G(K) \) splits over \( K \), then \( C_G(K) \cong \mathbb{Z}_3 \times L \), otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L \), which is impossible. Therefore, \( G \cong (\mathbb{Z}_3 \times L).\mathbb{Z}_2 \).

If \( |K| = 6 \), then \( G/K \cong L \) and \( K \cong \mathbb{Z}_6 \) or \( D_6 \).

If \( K \cong \mathbb{Z}_6 \), then \( G/C_G(K) \cong \mathbb{Z}_2 \) and so \( |G/C_G(K)| = 1 \) or 2. If \( |G/C_G(K)| = 1 \), then \( K \leq Z(G) \). It follows that \( \text{deg}(2) = 5 \), a contradiction. If \( |G/C_G(K)| = 2 \), then \( K < C_G(K) \) and \( 1 \neq C_G(K)/K \leq G/K \cong L \), which is a contradiction because \( L \) is simple.

If \( K \cong D_6 \), then \( K \cap C_G(K) = 1 \) and \( G/C_G(K) \cong D_6 \). Thus \( C_G(K) \neq 1 \). Hence, \( 1 \neq C_G(K) \cong C_G(K)/K \leq G/K \cong L \). It follows that \( L \cong G/K \cong C_G(K) \) because \( L \) is simple. Therefore, \( G \cong D_6 \times L \), which implies that \( \text{deg}(2) = 5 \), a contradiction.

**Proposition 3.8.** If \( M = L : (D_6\rangle_2 \), then \( G \cong L : (D_6\rangle_2, \mathbb{Z}_2 \times (L : 3), \mathbb{Z}_3 \times (L : 2_2), (\mathbb{Z}_3 \times L).\mathbb{Z}_2, \mathbb{Z}_6 \times L \) or \( S_3 \times L \).
Proof. As \(|L: (D_6)_{2}| = 2^{25}.3.5.7.13.17^2\) and \(\pi_{\pi}(L: (D_6)_{2}) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 17, 18, 20, 21, 24, 26, 30, 34, 39, 40, 42, 45, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\},\) then \(D(L: (D_6)_{2}) = (5, 5, 4, 2, 3, 3).\) Since \(|G| = |L: (D_6)_{2}|\) and \(D(G) = D(L: (D_6)_{2})\), we conclude that \(\Gamma(G)\) has the following form (like \(\Gamma(L: (D_6)_{2})\)):

![Diagram](image.png)

**Step 1.** Let \(K\) be the maximal normal solvable subgroup of \(G\). Then \(K\) is a \(\{2, 3\}\)-group. In particular, \(G\) is non-solvable.

The proof is similar to Step 1 in Proposition 3.5.

**Step 2.** The quotient \(\frac{G}{K}\) is an almost simple group. In fact, \(S \leq \frac{G}{K} \leq \text{Aut}(S)\), where \(S\) is a finite non-abelian simple group.

Let \(G = \frac{G}{K}\). Then \(S := \text{Soc}(G)\), \(S = P_1 \times P_2 \times \ldots \times P_m\), where \(P_i\)'s are finite non-abelian simple groups and \(S \leq \frac{G}{K} \leq \text{Aut}(S)\). We are going to prove that \(m = 1\) and \(S = P_1\). Suppose that \(m \geq 2\). By the same argument in Step 2 of Proposition 3.3 and considering 7 instead of a, we get a contradiction. Therefore \(m = 1\) and \(S = P_1\).

By TABLE 1 and Step 1, it is evident that \(|S| = 2^a.3^b.5.7.13.17^2\), where \(2 \leq a \leq 25\) and \(1 \leq b \leq 6\). Now, using collected results contained in TABLE 1, we conclude that \(S \cong D_4(4)\) and by Step 2, \(L \leq \frac{G}{K} \leq \text{Aut}(L)\). As \(|G| = |L: (D_6)_{2}| = 6|L|\), we deduce \(|K| = 1, 2, 3\) or 6.

If \(|K| = 1\), then \(G \cong L: (D_6)_{1}, L : (D_6)_{2}\) or \(L : 6\) because \(|G| = 6|L|\). Obviously \(G \cong L : (D_6)_{2}\) because in \(\Gamma(L: (D_6)_{1})\) and \(\Gamma(L : 6)\), we have \(\deg(13) = 2\) (see page 17).

If \(|K| = 2\), then \(K \leq Z(G)\) and \(G/K \cong L: 3\). Hence \(G\) is a central extension of \(K\) by \(L: 3\). If \(G\) splits over \(K\), then \(G \cong Z_2 \times (L: 3)\). Otherwise we get a contradiction because \(|K|\) must divide the Schure multiplier of \(L: 3\), which is impossible.

If \(|K| = 3\), then \(G/K \cong L: 2_1, L : 2_2\) or \(L : 2_3\). But \(G/C_G(K) \leq \text{Aut}(K) \cong Z_2\). Thus \(|G/C_G(K)| = 1\) or 2. If \(|G/C_G(K)| = 1\), then \(K \leq Z(G)\), that is, \(G\) is a central extension of \(K\) by \(L : 2_1, L : 2_2\) or \(L : 2_3\). If \(G\) splits over \(K\), then only \(G \cong Z_3 \times (L : 2_2)\) because \(2 \sim 13\) in \(\Gamma(Z_3 \times (L : 2_1))\) and \(\Gamma(Z_3 \times (L : 2_3))\). Otherwise we get a contradiction because \(|K|\) must divide the Schure multiplier of \(L : 2_1, L : 2_2\) and \(L : 2_3\), which is impossible. If
$|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$, we obtain $C_G(K)/K \cong L$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L$. If $C_G(K)$ splits over $K$, then $C_G(K) \cong Z_3 \times L$, otherwise we get a contradiction because $|K|$ must divide the Schure multiplier of $L$, which is impossible. Therefore, $G \cong (Z_3 \times L).Z_2$.

If $|K| = 6$, then $G/K \cong L$ and $K \cong Z_6$ or $D_6$. If $K \cong Z_6$, then $G/C_G(K) \lesssim Z_2$ and so $|G/C_G(K)| = 1$ or $2$. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$ and $G/K \cong L$. Therefore $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schure multiplier of $L$, which is 1. But this is a contradiction. So we obtain that $G$ splits over $K$. Hence $G \cong Z_6 \times L$. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$, which is a contradiction because $L$ is simple. If $K \cong D_6$, then $K \cap C_G(K) = 1$ and $G/C_G(K) \lesssim D_6$. Thus $C_G(K) \neq 1$. Hence, $1 \neq C_G(K) \cong C_G(K)K/K \leq G/K \cong L$. It follows that $L \cong G/K \cong C_G(K)$ because $L$ is simple. Therefore $G \cong D_6 \times L$. □

**Proposition 3.9.** If $M = L : 6$, then $G \cong L : 6$, $L : (D_6)_1$, $Z_3 \times (L : 2_1)$, $Z_3 \times (L : 2_3)$ or $(Z_3 \times L).Z_2$.

**Proof.** As $|L : 6| = 2^{25}.3^6.5^4.7.13.17^2$ and $\pi_e(L : 6) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 36, 39, 42, 45, 48, 51, 63, 65, 85, 255\}$, then $D(L : 6) = \{4, 5, 4, 2, 2, 3\}$. Since $|G| = |L : 6|$ and $D(G) = D(L : 6)$, there exist several possibilities for $\Gamma(G)$ similarly to Proposition 3.7.

![Figure 3.9](image)

where $\{a, b\} = \{7, 13\}$.

**Step 1.** Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

The proof is similar to that in Proposition 3.3.

**Step 2.** The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \lesssim \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

Again we refer to Step 2 of proposition 3.3 to get the proof.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha.3^3.5^\gamma.7.13.17^2$, where $2 \leq \alpha \leq 25$, $1 \leq \beta \leq 6$ and $0 \leq \gamma \leq 4$. Now, using collected results contained
In TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$. As $|G| = |L : 6| = 6|L|$, we deduce $|K| = 1, 2, 3$ or 6.

If $|K| = 1$, then $G \cong L = 6$, $L : (D_6)_1$ or $L : (D_6)_2$ because $|G| = 6|L|$. Obviously, $G \cong L = 6$ or $L : (D_6)_1$ because $\deg(2) = 5$ in $\Gamma(L : (D_6)_2)$ (see page 18).

If $|K| = 2$, then $K \leq Z(G)$ and so $\deg(2) = 5$, which is a contradiction.

If $|K| = 3$, then $G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$. But $G/C_G(K) \leq \text{Aut}(K) \cong Z_2$. Thus $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L : 2_1, L : 2_2$ or $L : 2_3$. If $G$ splits over $K$, then $G \cong Z_3 \times (L : 2_1)$ or $Z_3 \times (L : 2_3)$ because $\Gamma(Z_3 \times (L : 2_2))$ the degree of 2 is 5. Otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 2_1, L : 2_2$ and $L : 2_3$, which is impossible. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$, we obtain $C_G(K)/K \cong L$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L$. If $C_G(K)$ splits over $K$, then $C_G(K) \cong Z_3 \times L$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L$, which is impossible. Therefore, $G \cong (Z_3 \times L)Z_2$.

If $|K| = 6$, then $G/K \cong L$ and $K \cong Z_6$ or $D_6$. If $K \cong Z_6$, then $G/C_G(K) \cong Z_2$ and so $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$. It follows that $\deg(2) = 5$, a contradiction. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$, which is a contradiction because $L$ is simple. If $K \cong D_6$, then $K \cap C_G(K) = 1$ and $G/C_G(K) \cong D_6$. Thus $C_G(K) \neq 1$. Hence, $1 \neq C_G(K) \cong C_G(K)/K \leq G/K \cong L$. It follows that $L \cong G/K \cong C_G(K)$ because $L$ is simple. Therefore, $G \cong D_6 \times L$, which implies that $\deg(2) = 5$, a contradiction.

\square

**Proposition 3.10.** If $M = L : D_{12}$, then $G \cong L : D_{12}, Z_2 \times (L : (D_6)_1), Z_2 \times (L : (D_6)_2), Z_2 \times (L : 2^2), Z_3 \times (L : 2^2), (Z_3 \times (L : 2_1))Z_2, (Z_3 \times (L : 2_2))Z_2, Z_4 \times (L : 3), (Z_2 \times Z_2) \times (L : 3), (Z_4 \times L)Z_3, ((Z_3 \times Z_2) \times L)Z_3, Z_6 \times (L : 2_1), Z_6 \times (L : 2_2), Z_6 \times (L : 2_3), (Z_6 \times L)Z_2, S_3 \times (L : 2_1), S_3 \times (L : 2_2), S_3 \times (L : 2_3), Z_{12} \times L, (Z_2 \times Z_6) \times L, D_{12} \times L, (Z_2 \times L)D_6, A_4 \times L, L.A_4$ or $T \times L$.

\textbf{Proof.} As $|L : D_{12}| = 2^{26} \cdot 3^6 \cdot 5^4 \cdot 7 \cdot 13 \cdot 17^2$ and $\pi_e(L : (D_{12})) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 26, 30, 34, 39, 40, 42, 45, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}$, then $D(L : D_{12}) = (5, 5, 4, 2, 3, 3)$. Since $|G| = |L : D_{12}|$ and $D(G) = D(L : D_{12})$, we conclude that $\Gamma(G)$ has the following form (like $\Gamma(L : D_{12})$):
Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3\}$-group. In particular, $G$ is non-solvable.

The proof is similar to Step 1 in Proposition 3.5.

Step 2. The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \lesssim \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

To get the proof, follow the way in the proof of Step 2 in Proposition 3.5.

By TABLE 1 and Step 1, it is evident that $|S| = 2^a \cdot 3^b \cdot 5^c \cdot 7 \cdot 13 \cdot 17^2$, where $2 \leq a \leq 26$ and $1 \leq b \leq 6$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \lesssim \text{Aut}(L)$. As $|G| = |L : D_{12}| = 12|L|$, we deduce $|K| = 1, 2, 3, 4, 6$ or 12.

If $|K| = 1$, then $G \cong L : D_{12}$.

If $|K| = 2$, then $G/K \cong L : (D_6)_1, L : (D_6)_2$ or $L : 6$ and $K \leq Z(G)$. It follows that $G$ is a central extension of $K$ by $L : (D_6)_1, L : (D_6)_2$ or $L : 6$. If $G$ splits over $K$, then $G \cong \mathbb{Z}_2 \times (L : (D_6)_1), \mathbb{Z}_2 \times (L : (D_6)_2)$ or $\mathbb{Z}_2 \times (L : 6)$.

Otherwise $G \cong \mathbb{Z}_2(L : (D_6)_1)$ or $\mathbb{Z}_2(L : (D_6)_2)$.

If $|K| = 3$, then $G/K \cong L : 2^2$. But $G/C_G(K) \lesssim \text{Aut}(K) \cong \mathbb{Z}_2$. Thus $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L : 2^2$. If $G$ splits over $K$, then $G \cong \mathbb{Z}_3 \times (L : 2^2)$.

Otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 2^2$, which is impossible. If $|G/C_G(K)| = 2$, then $K \neq C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L : 2^2$, and we obtain $C_G(K)/K \cong L : 2_1, L : 2_2$ or $L : 2_3$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L : 2_1, L : 2_2$ or $L : 2_3$. Thus $C_G(K) \cong \mathbb{Z}_3 \times (L : 2_1), \mathbb{Z}_3 \times (L : 2_2)$ or $\mathbb{Z}_3 \times (L : 2_3)$, otherwise we get a contradiction because 3 must divide the Schur multiplier of $L : 2_1, L : 2_2$ or $L : 2_3$, which is impossible. Therefore, $G \cong (\mathbb{Z}_3 \times (L : 2_1)) \mathbb{Z}_2, (\mathbb{Z}_3 \times (L : 2_2)) \mathbb{Z}_2$ or $(\mathbb{Z}_3 \times (L : 2_3)) \mathbb{Z}_2$.

If $|K| = 4$, then $G/K \cong L : 3$ and $K \cong \mathbb{Z}_4$ or $\mathbb{Z}_2 \times \mathbb{Z}_2$. In this case we have $G/C_G(K) \lesssim \text{Aut}(K) \cong \mathbb{Z}_2$ or $S_3$.

Thus $|G/C_G(K)| = 1, 2, 3$ or 6. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L : 3$. If $G$ splits over $K$ by $L : 3$, then $G \cong \mathbb{Z}_4 \times (L : 3)$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times (L : 3)$. Otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 3$, which is impossible. If $|G/C_G(K)| \neq 1$, since $|G/C_G(K)| = 2, 3$ or 6, it follows that $K < C_G(K)$. As $L$ is simple, we conclude that $1 \neq C_G(K)/K$ must
be an extension of $L$. Hence $|G/C_G(K)| = 3$ and therefore $C_G(K)/K \cong L$. Now, since $K \leq Z(C_G(K))$, we conclude that $C_G(K)$ is a central extension of $K$ by $L$. Thus $C_G(K) \cong \mathbb{Z}_4 \times L$, or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L$, otherwise $|K|$ must divide the Schur multiplier of $L$, which is 1 and it is impossible. Therefore, $G \cong (\mathbb{Z}_4 \times L).\mathbb{Z}_3$ or $((\mathbb{Z}_2 \times \mathbb{Z}_2) \times L).\mathbb{Z}_3$.

If $|K| = 6$, then $G/K \cong L : 2_1$, $L : 2_2$ or $L : 2_3$ and $K \cong \mathbb{Z}_6$ or $D_6$. If $K \cong \mathbb{Z}_6$, then $G/C_G(K) \not\cong \mathbb{Z}_2$ and so $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is $G$ is a central extension of $\mathbb{Z}_6$ by $L : 2_1$, $L : 2_2$ or $L : 2_3$. If $G$ splits over $K$, we obtain $G \cong \mathbb{Z}_6 \times (L : 2_1)$, $\mathbb{Z}_6 \times (L : 2_2)$ or $\mathbb{Z}_6 \times (L : 2_3)$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L$, which is 1 and it is impossible. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L : 2_1$, $L : 2_2$ or $L : 2_3$, and we obtain $C_G(K)/K \cong L$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L$. Thus $C_G(K) \cong \mathbb{Z}_6 \times L$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L$. Therefore $G \cong (\mathbb{Z}_6 \times L).\mathbb{Z}_2$. If $K \cong D_6$, then $G/C_G(K) \not\cong D_6$ and so $|G/C_G(K)| = 1, 2, 3$ or 6. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is a contradiction. If $|G/C_G(K)| = 2$, then we have $|KC_G(K)| = 6, |G|/2 = 3|G|$ because $K \cap C_G(K) = 1$, which is a contradiction. If $|G/C_G(K)| = 3$, then we have $|KC_G(K)| = 6, |G|/3 = 2|G|$ because $K \cap C_G(K) = 1$, which is a contradiction. If $|G/C_G(K)| = 6$, then $G/C_G(K) \cong D_6$ and $C_G(K) \neq 1$. Hence, $1 \neq C_G(K) \cong C_G(K)/K \leq G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$. It follows that $C_G(K) \cong L : 2_1, L : 2_2$ or $L : 2_3$ because $L$ is simple. Therefore, $G \cong D_6 \times (L : 2_1), D_6 \times (L : 2_2)$ or $D_6 \times (L : 2_3)$.

Before processing the last case, we recall the following facts.

There exist five non-isomorphic groups of order 12. Two of them are abelian and three are non-abelian. The non-abelian groups are: alternating group $A_4$, dihedral group $D_{12}$ and the dicyclic group $T$ with generators $a$ and $b$, subject to the relations $a^6 = 1$, $a^3 = b^2$ and $b^{-1}ab = a^{-1}$.

If $|K| = 12$, then $G/K \cong L$ and $K \cong \mathbb{Z}_{12}$, $\mathbb{Z}_2 \times \mathbb{Z}_6$, $D_{12}$, $A_4$ or $T$. But $C_G(K)/K \leq G/K \cong L$. If $C_G(K)/K \cong L$, then $C_G(K) \leq K$ and hence $|L| = |G/K||G/C_G(K)||\text{Aut}(K)|$. Thus $|L||\text{Aut}(K)|$, a contradiction. Therefore, $C_G(K)/K \neq 1$ and since $L$ is simple group, we conclude that $G = C_G(K)K$ and hence, $G/C_G(K) \cong K/Z(K)$. Now, we should consider the following cases:

If $K \cong \mathbb{Z}_{12}$ or $\mathbb{Z}_2 \times \mathbb{Z}_6$, then $G/C_G(K) = 1$. Therefore $K \leq Z(G)$, that is $G$ is a central extension of $\mathbb{Z}_{12}$ or $\mathbb{Z}_2 \times \mathbb{Z}_6$ by $L$. If $G$ splits over $K$, we obtain $G \cong \mathbb{Z}_{12} \times L$ or $(\mathbb{Z}_2 \times \mathbb{Z}_6) \times L$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L$, which is 1 and it is impossible.
If $K \cong D_{12}$, then $G = K.L$ and $G/C_G(K) \cong D_6$. Since $C_G(K)/Z(K) \cong G/K \cong L$ and $Z(K) \leq Z(C_G(K))$, we conclude that $C_G(K)$ is a central extension of $Z(K) \cong \mathbb{Z}_2$ by $L$. If $C_G(K)$ is a non-split extension, then 2 must divide the Schur multiplier of $L$, which is 1 and it is impossible. Thus $C_G(K) \cong \mathbb{Z}_2 \times L$ and hence, $G$ is a split extension of $K$ by $L$. Now, since $\text{Hom}(L, \text{Aut}(D_{12}))$ is trivial, we have $G \cong D_{12} \times L$.

If $K \cong \mathbb{A}_4$, then $G/C_G(K) \cong \mathbb{A}_4$. As $G = C_G(K)K$, it follows that $C_G(K) \cong L$. Therefore $G \cong L \times \mathbb{A}_4$ or $L.\mathbb{A}_4$.

If $K \cong T$, then by the similar way in case $K \cong D_{12}$, we can conclude that $G$ is a split extension of $K$ by $L$. Also, since $\text{Hom}(L, \text{Aut}(T))$ is trivial, we have $G \cong T \times L$. \hfill \Box

According to what we said before the proof, here we depict $\Gamma(M)$ by $|M|$ and $\pi_e(M)$, where $M$ is an almost simple group related to $L = D_4(4)$.
