ABSTRACT. Let $G$ be a finite group and $\pi_e(G)$ be the set of orders of all elements in $G$. The set $\pi_e(G)$ determines the prime graph (or Grunberg-Kegel graph) $\Gamma(G)$ whose vertex set is $\pi(G)$. The set of primes dividing the order of $G$, and two vertices $p$ and $q$ are adjacent if and only if $pq \in \pi_e(G)$. The degree $\deg(p)$ of a vertex $p \in \pi(G)$, is the number of edges incident on $p$. Let $\pi(G) = \{p_1, p_2, ..., p_k\}$ with $p_1 < p_2 < ... < p_k$.

We define $D(G) := (\deg(p_1), \deg(p_2), ..., \deg(p_k))$, which is called the degree pattern of $G$. The group $G$ is called $k$-fold OD-characterizable if there exist exactly $k$ non-isomorphic groups $M$ satisfying conditions $|G| = |M|$ and $D(G) = D(M)$. Usually a 1-fold OD-characterizable group is simply called OD-characterizable. In this paper, we classify all finite groups with the same order and degree pattern as an almost simple groups related to $D_4(4)$.

Keywords: Degree pattern, $k$-fold OD-characterizable, Almost simple group.

1. Introduction

Let $G$ be a finite group, $\pi(G)$ the set of all prime divisors of $|G|$ and $\pi_e(G)$ be the set of orders of elements in $G$. The prime graph (or Grunberg-Kegel graph) $\Gamma(G)$ of $G$ is a simple graph with vertex set $\pi(G)$ in which two vertices $p$ and $q$ are joined by an edge (and we write $p \sim q$) if and only if $G$ contains an element of order $pq$ (i.e. $pq \in \pi_e(G)$).

The degree $\deg(p)$ of a vertex $p \in \pi(G)$ is the number of edges incident on $p$. If $\pi(G) = \{p_1, p_2, ..., p_k\}$ with $p_1 < p_2 < ... < p_k$, then we define $D(G) := (\deg(p_1), \deg(p_2), ..., \deg(p_k))$, which is called the degree pattern of $G$, and leads a following definition.

**Definition 1.1.** The finite group $G$ is called $k$-fold OD-characterizable if there exist exactly $k$ non-isomorphic groups $H$ satisfying conditions $|G| = |H|$ and $D(G) = D(H)$. In particular, a 1-fold OD-characterizable group is simply called OD-characterizable.

The interest in characterizing finite groups by their degree patterns started in [7] by M. R. Darafsheh and et. all, in which the authors proved that the following simple groups are uniquely determined by their order and degree patterns: All sporadic simple groups, the alternating groups $A_p$ with $p$ and $p - 2$ primes and some simple groups of Lie type. Also in a series of articles (see [4, 6, 8, 9, 14, 17]), it was shown that many finite simple groups are OD-characterizable.

Let $A$ and $B$ be two groups then a split extension is denoted by $A : B$. If $L$ is a finite simple group and $\text{Aut}(L) \cong L : A$, then if $B$ is a cyclic subgroup of $A$ of order $n$ we will write $L : n$ for the split extension $L : B$. Moreover if there are more than one subgroup of orders $n$ in $A$, then we will denote them by $L : n_1$, $L : n_2$, etc.

**Definition 1.2.** A group $G$ is said to be an almost simple group related to $S$ if and only if $S \leq G \leq \text{Aut}(S)$, for some non-abelian simple group $S$.

In many papers (see [2, 3, 10, 13, 15, 16]), it has been proved, up to now, that many finite almost simple groups are OD-characterizable or $k$-fold OD-characterizable for certain $k \geq 2$.

We denote the socle of $G$ by $\text{Soc}(G)$, which is the subgroup generated by the set of all minimal normal subgroups of $G$. For $p \in \pi(G)$, we denote by $G_p$ and $\text{Syl}_p(G)$ a Sylow $p$-subgroup of $G$ and the set of all Sylow $p$-subgroups of $G$ respectively, all further unexplained notation are standard and can be found in [11].

In this article our main aim is to show the recognizability of the almost simple groups related to $L := D_4(4)$ by degree pattern in the prime graph and
Main Theorem Let $M$ be an almost simple group related to $L := D_4(4)$. If $G$ is a finite group such that $D(G) = D(M)$ and $|G| = |M|$, then the following assertions hold:

(a) If $M = L$, then $G \cong L$.
(b) If $M = L : 2_1$, then $G \cong L : 2_1$ or $L : 2_3$.
(c) If $M = L : 2_2$, then $G \cong L : 2_2$ or $\mathbb{Z}_2 \times L$.
(d) If $M = L : 2_3$, then $G \cong L : 2_3$ or $L : 2_1$.
(e) If $M = L : 3$, then $G \cong L : 3$ or $\mathbb{Z}_3 \times L$.
(f) If $M = L : 2^2$, then $G \cong L : 2^2$, $\mathbb{Z}_2 \times (L : 2_1)$, $\mathbb{Z}_2 \times (L : 2_2)$, $\mathbb{Z}_2 \times (L : 2_3)$, $\mathbb{Z}_4 \times L$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L$.
(g) If $M = L : (D_6)_1$, then $G \cong L : (D_6)_1$, $L : 6$, $\mathbb{Z}_3 \times (L : 2_1)$, $\mathbb{Z}_3 \times (L : 2_3)$ or $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$.
(h) If $M = L : (D_6)_2$, then $G \cong L : (D_6)_2$, $\mathbb{Z}_2 \times (L : 3)$, $\mathbb{Z}_3 \times (L : 2_2)$, $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$, $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$ or $D_6 \times L$.
(i) If $M = L : 6$, then $G \cong L : 6$, $L : (D_6)_1$, $\mathbb{Z}_3 \times (L : 2_1)$, $\mathbb{Z}_3 \times (L : 2_3)$ or $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$.
(j) If $M = L : D_{12}$, then $G \cong L : D_{12}$, $\mathbb{Z}_2 \times (L : (D_6)_1)$, $\mathbb{Z}_2 \times (L : (D_6)_2)$, $\mathbb{Z}_2 \times (L : 6)$, $\mathbb{Z}_3 \times (L : 2^2)$, $(\mathbb{Z}_3 \times (L : 2_1)).\mathbb{Z}_2$, $(\mathbb{Z}_3 \times (L : 2_2)).\mathbb{Z}_2$, $(\mathbb{Z}_3 \times (L : 2_3)).\mathbb{Z}_2$, $\mathbb{Z}_4 \times (L : 3)$, $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times (L : 3)$, $(\mathbb{Z}_4 \times L).\mathbb{Z}_3$, $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L).\mathbb{Z}_3$, $\mathbb{Z}_6 \times (L : 2_1)$, $\mathbb{Z}_6 \times (L : 2_2)$, $\mathbb{Z}_6 \times (L : 2_3)$, $(\mathbb{Z}_6 \times L).\mathbb{Z}_2$, $D_6 \times (L : 2_1)$, $D_6 \times (L : 2_2)$, $D_6 \times (L : 2_3)$, $\mathbb{Z}_{12} \times L$, $(\mathbb{Z}_2 \times \mathbb{Z}_6) \times L$, $(\mathbb{Z}_2 \times L).D_6$, $A_4 \times L$, $L.A_4$, $D_{12} \times L$ or $T \times L$.

2. Preliminary Results

It is well-known that $\text{Aut}(D_4(4)) \cong D_4(4) : D_{12}$ where $D_{12}$ denotes the dihedral group of order 12. We remark that $D_{12}$ has the following non-trivial proper subgroups up to conjugacy: three subgroups of order 2, one cyclic subgroup each of order 3 and 6, two subgroups isomorphic to $D_6 \cong S_3$ and one subgroup of order 4 isomorphic to the Klein’s four group denoted by $2^2$. The field and the duality automorphisms of $D_4(4)$ are denoted by $\psi_1$ and $\psi_2$ respectively, and we set $2_3 = 2_1.2_2$ (field+duality which is called the diagonal automorphism).

Therefore up to conjugacy we have the following almost simple groups related to $D_4(4)$.

Lemma 2.1. If $G$ is an almost simple group related to $L := D_4(4)$, then $G$ is isomorphic to one of the following groups: $L, L : 2_1, L : 2_2, L : 2_3, L : 3, L : 2^2, L : (D_6)_1, L : (D_6)_2, L : 6, L : D_{12}$.

Lemma 2.2 ([5]). Let $G$ be a Frobenius group with kernel $K$ and complement $H$. Then:

(a) $K$ is a nilpotent group.
(b) $|K| \equiv 1(\text{mod}|H|)$. 
Let $p \geq 5$ be a prime. We denote by $\mathcal{S}_p$, the set of all simple groups with prime divisors at most $p$. Clearly, if $q \leq p$, then $\mathcal{S}_q \subseteq \mathcal{S}_p$. We list all the simple groups in class $\mathcal{S}_{17}$ with their order and the order of their outer automorphisms in TABLE 1, taken from [12].

**TABLE 1:** Simple groups in $\mathcal{S}_p$, $p \leq 17$.

| $S$   | $|S|$       | $|\text{Out}(S)|$ | $S$   | $|S|$       | $|\text{Out}(S)|$ |

Definition 2.3. A completely reducible group will be called a CR-group. The center of a CR-group is a direct product of the abelian factor in the decomposition. Hence, a CR-group is centerless, that is, has trivial center, if and only if it is a direct product of non-abelian simple groups. The following Lemma determines the structure of the automorphism group of a centerless CR-group.

Lemma 2.3 ([11]). Let $R$ be a finite centerless CR-group and write $R = R_1 \times R_2 \times \ldots \times R_k$, where $R_i$ is a direct product of $n_i$ isomorphic copies of a simple group $H_i$, and $H_i$ and $H_j$ are not isomorphic if $i \neq j$. Then $\text{Aut}(R) = \text{Aut}(R_1) \times \text{Aut}(R_2) \times \ldots \times \text{Aut}(R_k)$ and $\text{Aut}(R_i) \cong \text{Aut}(H_i) \wr S_{n_i}$, where in this wreath product $\text{Aut}(H_i)$ appears in its right regular representation and the symmetric group $S_{n_i}$ in its natural permutation representation. Moreover, these isomorphisms induce isomorphisms $\text{Out}(R) \cong \text{Out}(R_1) \times \text{Out}(R_2) \times \ldots \times \text{Out}(R_k)$ and $\text{Out}(R_i) \cong \text{Out}(H_i) \wr S_{n_i}$.

3. OD-Characterization of Almost Simple Groups Related to $D_4(4)$

In this section, we study the problem of characterizing almost simple groups by order and degree pattern. Especially we will focus our attention on almost simple groups related to $L = D_4(4)$, namely, we will prove the Main Theorem of Sec. 1. We break the proof into a number of separate propositions. By assumption, we depict all possibilities for the prime graph associated with $G$ by use of the variables for some vertices in each proposition. Also, we need to know the structure of $\Gamma(M)$ to determine the possibilities for $G$ in some proposition, therefore we depict the prime graph of all extension of $L$ in pages 18 to 20. Note that the set of order elements in each of the following propositions is calculated using Magma.

Proposition 3.1. If $M = L$, then $G \cong L$.

Proof. By TABLE 1 $|L| = 2^{24}.3^5.5^4.7.13.17^2$. $\pi_e(L) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 15, 17, 20, 21, 30, 34, 51, 63, 65, 85, 255\}$, so $D(L) = (3, 4, 4, 1, 1, 3)$. Since $|G| = |L|$ and $D(G) = D(L)$, we conclude that the prime graph of $G$ has following form:

![Figure 3.1](attachment:image.png)

where $\{a, b\} = \{7, 13\}$. 
We will show that $G$ is isomorphic to $L = D_4(4)$. We break up the proof into several steps.

**Step 1.** Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

First we show that $K$ is a $17'$-group. Assume the contrary and let $17 \in \pi(K)$. Then $17$ dose not divide the order of $K$. Otherwise, we may suppose that $T$ is a Hall $\{13, 17\}$-subgroup of $K$. It is seen that $T$ is a nilpotent subgroup of order $13.17^i$ for $i = 1$ or $2$. Thus, $13.17 \in \pi_e(K) \subseteq \pi_e(G)$, a contradiction. Thus $\{17\} \subseteq \pi(K) \subseteq \pi(G) - \{13\}$. Let $K_{17} \in \text{Syl}_{17}(K)$. By Frattini argument, $G = K\text{N}_G(K_{17})$. Therefore, $N_G(K_{17})$ contains an element $x$ of order $13$. Since $G$ has no element of order $13.17$, $(x)$ should act fixed point freely on $K_{17}$, that is implying $(x)K_{17}$ is a Frobenius group. By Lemma 2.2(b), $|\langle x \rangle|/(|K_{17}| - 1)$. It follows that $13|17^i - 1$ for $i = 1$ or $2$, which is a contradiction.

Next, we show that $K$ is a $p'$-group for $p \in \{a, b\}$. Let $p||K|$ and $K_p \in \text{Syl}_p(K)$. Now by Frattini argument, $G = K\text{N}_G(K_p)$, so $17$ must divide the order of $N_G(K_p)$. Therefore, the normalizer $N_G(K_p)$ contains an element of order $17$, say $x$. So $(x)K_p$ is a cyclic subgroup of $G$ of order $17.p$, and so $p \sim 17$ in $\Gamma(G)$, which is a contradiction. Therefore $K$ is a $\{2, 3, 5\}$-group. In addition, since $K$ is a proper subgroup of $G$, it follows that $G$ is non-solvable.

**Step 2.** The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group isomorphic to $L := D_4(4)$.

Let $\overline{G} = G/K$. Then $S := \text{Soc}(\overline{G}) = P_1 \times P_2 \times \ldots \times P_m$, where $P_i$s are finite non-abelian simple groups and $S \leq \overline{G} \leq \text{Aut}(S)$. If we show that $m = 1$, the proof of Step 2 will be completed.

Suppose that $m \geq 2$. In this case, we claim that $13$ does not divide $|S|$. Assume the contrary and let $13 \mid |S|$, on the other hand, $\{2, 3\} \subset \pi(P_i)$ for every $i$ (by TABLE 1), hence $2 \sim 13$ and $3 \sim 13$, which is a contradiction. Now, by step 1, we observe that $13 \in \pi(\overline{G}) \subseteq \pi(\text{Aut}(S))$. But $\text{Aut}(S) = \text{Aut}(S_1) \times \text{Aut}(S_2) \times \ldots \times \text{Aut}(S_t)$, where the groups $S_j$ are direct products of isomorphic $P_i$’s such that $S = S_1 \times S_2 \times \ldots \times S_t$. Therefore, for some $j$, $13$ divides the order of an automorphism group of a direct product $S_j$ of $t$ isomorphic simple groups $P_i$. Since $P_i \in \mathcal{S}_{17}$, it follows that $|\text{Out}(P_i)|$ is not divisible by $13$ (see TABLE 1). Now, by Lemma 2.3, we obtain $|\text{Aut}(S_j)| = |\text{Aut}(P_i)|^t \frac{t!}{t}$. Therefore, $t \geq 13$ and so $2^{26}$ must divide the order of $G$, which is a contradiction. Therefore $m = 1$ and $S = P_1$.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha 3^\beta 5^\gamma 7.13.17^2$, where $2 \leq \alpha \leq 24$, $1 \leq \beta \leq 5$ and $0 \leq \gamma \leq 4$. Now, using collected results contained in TABLE 1, we deduce that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$ is completed. As $|G| = |L|$, we deduce $K = 1$, so $G \cong L$ and the proof is completed. □
Proposition 3.2. If \( M = L : 2_1 \), then \( G \cong L : 2_1 \) or \( L : 2_3 \).

Proof. As \( |L : 2_1| = 2^{25}.3^5.5^4.7.13.17^2 \) and \( \pi_e(L : 2_1) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 40, 42, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255 \} \), then \( D(L : 2_1) = (4, 4, 2, 1, 3) \). Since \( |G| = |L : 2_1| \) and \( D(G) = D(L : 2_1) \), we conclude that there exist several possibilities for \( \Gamma(G) \):

![Figure 3.2](image)

where \( \{a, b, c\} = \{2, 3, 5\} \).

**Step 1.** Let \( K \) be the maximal normal solvable subgroup of \( G \). Then \( K \) is a \( \{2, 3, 5\} \)-group. In particular, \( G \) is non-solvable.

By a similar argument to that in Proposition 3.1, we can obtain this assertion.

**Step 2.** The quotient \( \frac{G}{K} \) is an almost simple group. In fact, \( S \leq \frac{G}{K} \leq \text{Aut}(S) \), where \( S \) is a finite non-abelian simple group.

The proof is similar to Step 2 of Proposition 3.1.

By TABLE 1 and Step 1, it is evident that \( |S| = 2^α.3^β.5^γ.7.13.17^2 \), where \( 2 \leq α \leq 25, 1 \leq β \leq 5 \) and \( 0 \leq γ \leq 4 \). Now, using collected results contained in TABLE 1, we conclude that \( S \cong D_4(4) \) and by Step 2, \( L \leq \frac{G}{K} \leq \text{Aut}(L) \). As \( |G| = |L : 2_1| = 2|L| \), we deduce \( |K| = 1 \) or \( 2 \).

If \( |K| = 1 \), then \( G \cong L : 2_1, L : 2_2 \) or \( L : 2_3 \). Obviously, \( G \cong L : 2_1 \) or \( L : 2_3 \) because \( \text{deg}(2) = 5 \) in \( \Gamma(L : 2_2) \) (see page 16).

If \( |K| = 2 \), then \( K \leq Z(G) \) and so \( \text{deg}(2) = 5 \), which is a contradiction. \( \square \)

Proposition 3.3. If \( M = L : 2_2 \), then \( G \cong L : 2_2 \) or \( \mathbb{Z}_2 \times L \).

Proof. As \( |L : 2_2| = 2^{25}.3^4.5^4.7.13.17^2 \) and \( \pi_e(L : 2_2) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 17, 18, 20, 21, 24, 26, 30, 34, 40, 42, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255 \} \), then \( D(L : 2_2) = (5, 4, 4, 2, 2, 3) \). By assumption \( |G| = |L : 2_2| \) and \( D(G) = D(L : 2_2) \), so the prime graph of \( G \) has following form:

![Figure 3.3](image)

where \( \{a, b\} = \{7, 13\} \).
Step1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable. By similar arguments as in the proof of Step 1 in Proposition 3.1, we conclude that $K$ is a $\{2, 3, 5\}$-group and $G$ is non-solvable.

Step 2. The quotient $\frac{G}{K}$ is an almost simple group. In fact, $S \leq \frac{G}{K} \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

Let $\overline{G} = \frac{G}{K}$. Then $S := \text{Soc}(\overline{G})$, $S = P_1 \times P_2 \times \ldots \times P_m$, where $P_i$'s are finite non-abelian simple groups and $S \leq \frac{G}{K} \leq \text{Aut}(S)$. We are going to prove that $m = 1$ and $S = P_1$. Suppose that $m \geq 2$. We claim $a$ does not divide $|S|$. Assume the contrary and let $a \mid |S|$, we conclude that a just divide the order of one of the simple groups $P_i$'s. Without loss of generality, we assume that $a || P_1|$. Then the rest of the $P_i$'s must be $\{2, 3\}$-group (because only 2 and 3 are adjacent to a in $\Gamma(G)$), this is a contradiction because $P_i$'s are finite non-abelian simple groups. Now, by Step 1, we observe that $a \in \pi(\overline{G}) \subseteq \pi(\text{Aut}(S))$. But $\text{Aut}(S) = \text{Aut}(S_1) \times \text{Aut}(S_2) \times \ldots \times \text{Aut}(S_t)$, where the groups $S_j$ are direct products of isomorphic $P_i$'s such that $S = S_1 \times S_2 \times \ldots \times S_t$. Therefore, for some $j$, $a$ divides the order of an automorphism group of a direct product $S_j$ of $t$ isomorphic simple groups $P_i$. Since $P_i \in \mathcal{S}_{17}$, it follows that $|\text{Out}(P_i)|$ is not divisible by $a$ (see TABLE 1), so a does not divide the order of $\text{Aut}(P_i)$. Now, by Lemma 2.3, we obtain $|\text{Aut}(S_j)| = |\text{Aut}(P_i)|^{t!}$, $t!$. Therefore, $t \geq a$ and so $3^a$ must divide the order of $G$, which is a contradiction. Therefore $m = 1$ and $S = P_1$.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha 3^\beta 5^\gamma 7.13.17^2$, where $2 \leq \alpha \leq 25$, $1 \leq \beta \leq 5$ and $0 \leq \gamma \leq 4$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq \frac{G}{K} \leq \text{Aut}(L)$. As $|G| = |L : 2_2| = 2|L|$, we deduce $|K| = 1$ or 2.

If $|K| = 1$, then $G \cong L : 2_1$, $L : 2_2$ or $L : 2_3$ because $|G| = 2|L|$. It is obvious that $G \cong L : 2_2$, because $\deg(13) = 1$ in $\Gamma(L : 2_1)$ and $\Gamma(L : 2_3)$ (see page 17).

If $|K| = 2$, then $G/K \cong L$ and $K \leq Z(G)$. It follows that $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is 1. But this is a contradiction, so we obtain that $G$ split over $|K|$. Hence $G \cong Z_2 \times L$.

\[\Box\]

**Proposition 3.4.** If $M = L : 2_3$, then $G \cong L : 2_3$ or $L : 2_1$.

**Proof.** As $|L : 2_3| = 2^{25} 3^2 5^4 7.13.17^2$ and $\pi_e(L : 2_3) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 51, 63, 65, 85, 255\}$, then $D(L : 2_3) = (4, 4, 4, 2, 1, 3)$. Since $|G| = |L : 2_3|$ and $D(G) = D(L : 2_3)$, we conclude that $\Gamma(G)$ has the following form similarly to Proposition 3.2:
Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

We can prove this by the similar way to that in Proposition 3.2.

Step 2. The quotient $\frac{G}{K}$ is an almost simple group. In fact, $S \leq \frac{G}{K} \lesssim \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

By using a similar argument, as in the proof of Proposition 3.2, we can verify that $\frac{G}{K}$ is an almost simple group.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha 3^\beta 5^\gamma 7^2 13 17 2$, where $2 \leq \alpha \leq 25$, $1 \leq \beta \leq 5$ and $0 \leq \gamma \leq 4$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq \frac{G}{K} \lesssim \text{Aut}(L)$. As $|G| = |L : 2_3| = 2|L|$, we deduce $|K| = 1$ or $2$.

If $|K| = 1$, then $G \cong L : 2_1$, $L : 2_2$ or $L : 2_3$ because $|G| = 2|L|$. Obviously, $G \cong L : 2_3$ or $L : 2_1$, because $\deg(2) = 5$ in $\Gamma(L : 2_2)$ (see page 16).

If $|K| = 2$, then $K \leq Z(G)$ and so $\deg(2) = 5$, which is a contradiction. □

Proposition 3.5. If $M = L : 3$, then $G \cong L : 3$ or $\mathbb{Z}_3 \times L$.

Proof. As $|L : 3| = 2^{24} 3^6 5^4 7 13 17^2$ and $\pi_c(L : 3) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 15, 17, 18, 20, 21, 24, 30, 34, 39, 45, 51, 63, 65, 85, 255\}$, then $D(L : 3) = \{3, 5, 4, 1, 2, 3\}$. Since $|G| = |L : 3|$ and $D(G) = D(L : 3)$, we conclude that $\Gamma(G)$ has the following form (like $\Gamma(L : 3)$):

Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3\}$-group. In particular, $G$ is non-solvable.

First, we show that $K$ is a $p$-group for $p = 7, 13$ and 17. Since the proof is quite similar to the proof of Step 1 in Proposition 3.1, so we avoid here full explanation of all details.
Next we consider $K$ is a $5'$-group. Assume the contrary, $5 \in \pi_e(K)$. Let $K_5 \in \text{Syl}_5(K)$. By Frattini argument, $G = K \cap G(K_5)$. Therefore, $N_G(K_5)$ has an element $x$ of order 7. Since $G$ has no element of order 5, $\langle x \rangle$ should act fixed point freely on $K_5$, implying $\langle x \rangle K_5$ is a Frobenius group. By Lemma 2.2(b), $\langle x \rangle \mid (|K_5| - 1)$, which is impossible. Therefore $K$ is a $\{2,3\}$-group.

In addition since $K$ is a proper subgroup of $G$, then $G$ is non-solvable and the proof of this step is completed.

**Step 2.** The quotient $\frac{G}{K}$ is an almost simple group. In fact, $S \leq \frac{G}{K} \trianglelefteq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

In a similar way as in the proof of Step 2 in Proposition 3.1, we conclude that $\frac{G}{K}$ is an almost simple group.

By TABLE 1 and Step 1, it is evident that $|S| = 2^{26}.3^5.5^4.7.13.17^2$, where $2 \leq \alpha \leq 24$ and $1 \leq \beta \leq 6$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq \frac{G}{K} \trianglelefteq \text{Aut}(L)$. As $|G| = |L : 3| = 3|L|$, we deduce $|K| = 1$ or 3.

If $|K| = 1$, then $G \cong L : 3$.

If $|K| = 3$, then $G/K \cong L$. In this case we have $G/C_G(K) \cong \text{Aut}(K) \cong \mathbb{Z}_2$. Thus $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is 1. But this is a contradiction, so we obtain that $G$ split over $K$. Hence $G \cong \mathbb{Z}_3 \times L$. If $|G/C_G(K)| = 2$, then $K \not\leq C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$, which is a contradiction since $L$ is simple.

**Proposition 3.6.** If $M = L : 2^2$, then $G \cong L : 2^2$, $\mathbb{Z}_2 \times (L : 2_1)$, $\mathbb{Z}_2 \times (L : 2_2)$, $\mathbb{Z}_2 \times (L : 2_3)$, $\mathbb{Z}_3 \times L$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L$.

**Proof.** As $|L : 2^2| = 2^{26}.3^5.5^4.7.13.17^2$ and $\pi_e(L : 2^2) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 26, 30, 34, 42, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}$, then $D(L : 2^2) = (5, 4, 4, 2, 2, 3)$. Since $|G| = |L : 2^2|$ and $D(G) = D(L : 2^2)$, so the prime graph of $G$ has following form similarly to Proposition 3.3:

![Figure 3.6](image_url)

where $\{a, b\} = \{7, 13\}$.
Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2,3,5\}$-group. In particular, $G$ is non-solvable.

According to Step 1 in Proposition 3.3, we have $K$ is a $\{2,3,5\}$-group and $G$ is non-solvable.

Step 2. The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

We can prove this by the similar argument in Step 2 in Proposition 3.3.

By TABLE 1 and Step 1, it is evident that $|S| = 2^α.3^β.5^γ.7.13.17^2$, where $2 \leq α \leq 26$, $1 \leq β \leq 5$ and $0 \leq γ \leq 4$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$. As $|G| = |L : 2^2| = 4|L|$, we deduce $|K| = 1, 2$ or $4$.

If $|K| = 1$, then $G \cong L : 2^2$.

If $|K| = 2$, then $K \leq Z(G)$. In this case $G$ is a central extension of $\mathbb{Z}_2$ by $L : 2_1$, $L : 2_2$ or $L : 2_3$. If $G$ splits over $K$ then $G \cong \mathbb{Z}_2 \times (L : 2_1)$, $\mathbb{Z}_2 \times (L : 2_2)$ or $\mathbb{Z}_2 \times (L : 2_3)$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 2_1$, $L : 2_2$ and $L : 2_3$, which is impossible.

If $|K| = 4$, then $G/K \cong L$. In this case we have $G/C_G(K) \leq \text{Aut}(K) \cong \mathbb{Z}_2$ or $S_3$. Thus $|G/C_G(K)| = 1, 2, 3$ or $6$. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is $1$, but this is a contradiction. Therefore $G$ splits over $K$. Hence $G \cong K \times L$. So we have $G \cong \mathbb{Z}_4 \times L$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times L$ because $K \cong \mathbb{Z}_4$ or $\mathbb{Z}_2 \times \mathbb{Z}_2$. If $|G/C_G(K)| = 2, 3$ or $6$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$. Which is a contradiction, since $L$ is simple.

Proposition 3.7. If $M = L : (D_6)_1$, then $G \cong L : (D_6)_1$, $L : 6$, $\mathbb{Z}_3 \times (L : 2_1)$, $\mathbb{Z}_3 \times (L : 2_2)$ or $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$.

Proof. As $|L : (D_6)_1| = 2^{25}.3^6.5^4.7.13.17^2$ and $π_e(L : (D_6)_1) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 39, 42, 45, 51, 60, 63, 65, 85, 255\}$, then $D(L : (D_6)_1) = \{4, 5, 4, 2, 2, 3\}$. Since $|G| = |L : (D_6)_1|$ and $D(G) = D(L : (D_6)_1)$, we conclude that there exist several possibilities for $\Gamma(G)$:

![Figure 3.7](image-url)
where \( \{a, b\} = \{7, 13\} \).

**Step 1.** Let \( K \) be the maximal normal solvable subgroup of \( G \). Then \( K \) is a \( \{2, 3, 5\} \)-group. In particular, \( G \) is non-solvable.

By the similar argument to that in Step 1 in Proposition 3.1, we can obtain this assertion.

**Step 2.** The quotient \( \frac{G}{K} \) is an almost simple group. In fact, \( S \leq \frac{G}{K} \leq \text{Aut}(S) \), where \( S \) is a finite non-abelian simple group.

The proof is similar to Step 2 in Proposition 3.3.

By TABLE 1 and Step 1, it is evident that \( |S| = 2^a 3^b 5^c 7^d 13^{e} 17^f \), where \( 2 \leq a \leq 25 \), \( 1 \leq b \leq 6 \) and \( 0 \leq \gamma \leq 4 \). Now, using collected results contained in TABLE 1, we conclude that \( S \cong D_4(4) \) and by Step 2, \( L \leq \frac{G}{K} \leq \text{Aut}(L) \). As \( |G| = |L : D_6|_1 = 6|L| \), we deduce \( |K| = 1, 2, 3 \) or 6.

If \( |K| = 1 \), then \( G \cong L : (D_6)_1, L : (D_6)_2 \) or \( L : 6 \) because \( |G| = 6|L| \).

Obviously, \( G \cong L : (D_6)_1 \) or \( L : 6 \) because \( \deg(2) = 5 \) in \( \Gamma(L : (D_6)_2) \).

If \( |K| = 2 \), then \( K \leq Z(G) \) and so \( \deg(2) = 5 \), which is a contradiction (see page 18).

If \( |K| = 3 \), then \( G/K \cong L : 2_1, L : 2_2 \) or \( L : 2_3 \). But \( G/C_G(K) \leq \text{Aut}(K) \cong Z_2 \). Thus \( |G/C_G(K)| = 1 \) or 2. If \( |G/C_G(K)| = 1 \), then \( K \leq Z(G) \), that is, \( G \) is a central extension of \( K \) by \( L : 2_1, L : 2_2 \) or \( L : 2_3 \). If \( G \) splits over \( K \), then \( G \cong Z_3 \times (L : 2_1) \) or \( Z_3 \times (L : 2_3) \) because in \( \Gamma(Z_3 \times (L : 2_2)) \) the degree of 2 is 5. Otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L : 2_1, L : 2_2 \) and \( L : 2_3 \), which is impossible. If \( |G/C_G(K)| = 2 \), then \( K < C_G(K) \) and \( 1 \neq C_G(K)/K \leq G/K \cong L : 2_1, L : 2_2 \) or \( L : 2_3 \), we obtain \( G/K \cong L \). Since \( K \leq Z(C_G(K)) \), \( C_G(K) \) is a central extension of \( K \) by \( L \). If \( C_G(K) \) splits over \( K \), then \( C_G(K) \cong Z_3 \times L \), otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L \), which is impossible. Therefore, \( G \cong (Z_3 \times L).Z_2 \).

If \( |K| = 6 \), then \( G/K \cong L \) and \( K \cong Z_6 \) or \( D_6 \).

If \( K \cong Z_6 \), then \( G/C_G(K) \cong Z_2 \) and so \( |G/C_G(K)| = 1 \) or 2. If \( |G/C_G(K)| = 1 \), then \( K \leq Z(G) \). It follows that \( \deg(2) = 5 \), a contradiction. If \( |G/C_G(K)| = 2 \), then \( K < C_G(K) \) and \( 1 \neq C_G(K)/K \leq G/K \cong L \), which is a contradiction because \( L \) is simple.

If \( K \cong D_6 \), then \( K \cap C_G(K) = 1 \) and \( G/C_G(K) \cong D_6 \). Thus \( C_G(K) \neq 1 \).

Hence, \( 1 \neq C_G(K) \cong C_G(K)/K \leq G/K \cong L \). It follows that \( L \cong G/K \cong C_G(K) \) because \( L \) is simple. Therefore, \( G \cong D_6 \times L \), which implies that \( \deg(2) = 5 \), a contradiction.

**Proposition 3.8.** If \( M = L : (D_6)_2 \), then \( G \cong L : (D_6)_2, Z_2 \times (L : 3), Z_3 \times (L : 2_2), (Z_3 \times L).Z_2, Z_6 \times L \) or \( S_3 \times L \).
Proof. As \(|L : (D_6)_2| = 2^{25}.3^6.5^4.7.13.17^2\) and \(\pi_e(L : (D_6)_2) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 17, 18, 20, 21, 24, 26, 30, 34, 39, 40, 42, 45, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}\), then \(D(L : (D_6)_2) = (5, 5, 4, 2, 3, 3)\). Since \(|G| = |L : (D_6)_2|\) and \(D(G) = D(L : (D_6)_2)\), we conclude that \(\Gamma(G)\) has the following form (like \(\Gamma(L : (D_6)_2)\)):

![Figure 3.8](image-url)

**Step1.** Let \(K\) be the maximal normal solvable subgroup of \(G\). Then \(K\) is a \(\{2, 3\}\)-group. In particular, \(G\) is non-solvable.

The proof is similar to Step 1 in Proposition 3.5.

**Step 2.** The quotient \(G/K\) is an almost simple group. In fact, \(S \leq G/K \trianglelefteq \mathrm{Aut}(S)\), where \(S\) is a finite non-abelian simple group.

Let \(G = G/K\). Then \(S := \mathrm{Soc}(G)\), \(S = P_1 \times P_2 \times \ldots \times P_m\), where \(P_i\)'s are finite non-abelian simple groups and \(S \leq G/K \trianglelefteq \mathrm{Aut}(S)\). We are going to prove that \(m = 1\) and \(S = P_1\). Suppose that \(m \geq 2\). By the same argument in Step 2 of Proposition 3.3 and considering \(7\) instead of \(a\), we get a contradiction. Therefore \(m = 1\) and \(S = P_1\).

By TABLE 1 and Step 1, it is evident that \(|S| = 2^\alpha.3^\beta.5^4.7.13.17^2\), where \(2 \leq \alpha \leq 25\) and \(1 \leq \beta \leq 6\). Now, using collected results contained in TABLE 1, we conclude that \(S \cong D_4(4)\) and by Step 2, \(L \leq G/K \trianglelefteq \mathrm{Aut}(L)\). As \(|G| = |L : D_6)_2| = 6|L|\), we deduce \(|K| = 1, 2, 3\) or \(6\).

If \(|K| = 1\), then \(G \cong L : (D_6)_1, L : (D_6)_2\) or \(L : 6\) because \(|G| = 6|L|\).

Obviously \(G \cong L : (D_6)_2\) because in \(\Gamma(L : (D_6)_1)\) and \(\Gamma(L : 6)\), we have \(\deg(13) = 2\) (see page 17).

If \(|K| = 2\), then \(K \leq Z(G)\) and \(G/K \cong L : 3\). Hence \(G\) is a central extension of \(K\) by \(L : 3\). If \(G\) splits over \(K\), then \(G \cong \mathbb{Z}_2 \times (L : 3)\). Otherwise we get a contradiction because \(|K|\) must divide the Schur multiplier of \(L : 3\), which is impossible.

If \(|K| = 3\), then \(G/K \cong L : 2_1, L : 2_2\) or \(L : 2_3\). But \(G/C_G(K) \cong \mathrm{Aut}(K) \cong \mathbb{Z}_2\). Thus \(|G/C_G(K)| = 1\) or \(2\). If \(|G/C_G(K)| = 1\), then \(|K| \cong Z(G)\), that is, \(G\) is a central extension of \(K\) by \(L : 2_1, L : 2_2\) or \(L : 2_3\). If \(G\) splits over \(K\), then only \(G \cong \mathbb{Z}_3 \times (L : 2_2)\) because \(2 \approx 13\) in \(\Gamma(\mathbb{Z}_3 \times (L : 2_1))\) and \(\Gamma(\mathbb{Z}_3 \times (L : 2_3))\). Otherwise we get a contradiction because \(|K|\) must divide the Schur multiplier of \(L : 2_1, L : 2_2\) and \(L : 2_3\), which is impossible. If
$|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \trianglelefteq G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$, we obtain $C_G(K)/K \cong L$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L$. If $C_G(K)$ splits over $K$, then $C_G(K) \cong \mathbb{Z}_3 \times L$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L$, which is impossible. Therefore, $G \cong (\mathbb{Z}_3 \times L).\mathbb{Z}_2$.

If $|K| = 6$, then $G/K \cong L$ and $K \cong \mathbb{Z}_6$ or $D_6$. If $K \cong \mathbb{Z}_6$, then $G/C_G(K) \leq \mathbb{Z}_2$ and so $|G/C_G(K)| = 1$ or $2$. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$ and $G/K \cong L$. Therefore $G$ is a central extension of $K$ by $L$. If $G$ is a non-split extension of $K$ by $L$, then $|K|$ must divide the Schur multiplier of $L$, which is $1$. But this is a contradiction. So we obtain that $G$ splits over $K$. Hence $G \cong \mathbb{Z}_6 \times L$. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$, which is a contradiction because $L$ is simple. If $K \cong D_6$, then $K \cap C_G(K) = 1$ and $G/C_G(K) \leq D_6$. Thus $C_G(K) \neq 1$. Hence, $1 \neq C_G(K) \cong C_G(K)/K \leq G/K \cong L$. It follows that $L \cong G/K \cong C_G(K)$ because $L$ is simple. Therefore $G \cong D_6 \times L$.

\begin{proposition}
If $M = L : 6$, then $G \cong L : 6$, $L : (D_6)_1, \mathbb{Z}_3 \times (L : 2_1), \mathbb{Z}_3 \times (L : 2_3)$ or $(\mathbb{Z}_3 \times L).\mathbb{Z}_2$.
\end{proposition}

\begin{proof}
As $|L : 6| = 2^{25}.3^6.5^4.7.13.17^2$ and $\pi_e(L : 6) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 30, 34, 36, 39, 42, 45, 48, 51, 63, 65, 85, 255\}$, then $D(L : 6) = (4, 5, 4, 2, 2, 3)$. Since $|G| = |L : 6|$ and $D(G) = D(L : 6)$, there exist several possibilities for $\Gamma(G)$ similarly to Proposition 3.7:

Figure 3.9

where $\{a, b\} = \{7, 13\}$.

**Step 1.** Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3, 5\}$-group. In particular, $G$ is non-solvable.

The proof is similar to that in Proposition 3.3.

**Step 2.** The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

Again we refer to Step 2 of proposition 3.3 to get the proof.

By TABLE 1 and Step 1, it is evident that $|S| = 2^\alpha.3^\beta.5^\gamma.7.13.17^2$, where $2 \leq \alpha \leq 25, 1 \leq \beta \leq 6$ and $0 \leq \gamma \leq 4$. Now, using collected results contained
in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq \frac{G}{K} \leq \text{Aut}(L)$. As $|G| = |L : 6| = 6|L|$, we deduce $[K] = 1, 2, 3$ or $6$.

If $|K| = 1$, then $G \cong L : 6$, $L : (D_6)_1$ or $L : (D_6)_2$ because $|G| = 6|L|$. Obviously, $G \cong L : 6$ or $L : (D_6)_1$ because $\text{deg}(2) = 5$ in $\Gamma(L : (D_6)_2)$ (see page 18).

If $|K| = 2$, then $K \leq Z(G)$ and so $\text{deg}(2) = 5$, which is a contradiction.

If $|K| = 3$, then $G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$. But $G/C_G(K) \leq \text{Aut}(K) \cong \mathbb{Z}_2$. Thus $|G/C_G(K)| = 1$ or $2$. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L : 2_1, L : 2_2$ or $L : 2_3$. If $G$ splits over $K$, then $G \cong \mathbb{Z}_3 \times (L : 2_1)$ or $\mathbb{Z}_3 \times (L : 2_2)$ because in $\Gamma(\mathbb{Z}_3 \times (L : 2_2))$ the degree of $Z(G)$ is $2$ or $5$. Otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 2_1, L : 2_2$ and $L : 2_3$, which is impossible. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L : 2_1, L : 2_2$ or $L : 2_3$, we obtain $C_G(K)/K \cong L$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L$. If $C_G(K)$ splits over $K$, then $C_G(K) \cong \mathbb{Z}_3 \times L$, otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L$, which is impossible. Therefore, $G \cong (\mathbb{Z}_3 \times L).\mathbb{Z}_2$.

If $|K| = 6$, then $G/K \cong L$ and $K \cong \mathbb{Z}_6$ or $D_6$. If $K \cong \mathbb{Z}_6$, then $G/C_G(K) \leq \mathbb{Z}_2$ and so $|G/C_G(K)| = 1$ or $2$. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$. It follows that $\text{deg}(2) = 5$, a contradiction. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \leq G/K \cong L$, which is a contradiction because $L$ is simple. If $K \cong D_6$, then $K \cap C_G(K) = 1$ and $G/C_G(K) \leq D_6$. Thus $C_G(K) \neq 1$. Hence, $1 \neq C_G(K) \cong C_G(K)/K \leq G/K \cong L$. It follows that $L \cong G/K \cong C_G(K)$ because $L$ is simple. Therefore, $G \cong D_6 \times L$, which implies that $\text{deg}(2) = 5$, a contradiction.

\[\square\]

Proposition 3.10. If $M = L : D_{12}$, then $G \cong L : D_{12}$, $\mathbb{Z}_2 \times (L : (D_6)_1)$, $\mathbb{Z}_2 \times (L : (D_6)_2)$, $\mathbb{Z}_2 \times (L : (D_6)_3)$, $\mathbb{Z}_2 \times (L : 2^2)$, $(\mathbb{Z}_3 \times (L : 2_1)).\mathbb{Z}_2$, $(\mathbb{Z}_3 \times (L : 2_2)).\mathbb{Z}_2$, $(\mathbb{Z}_4 \times (L : 2_3)).\mathbb{Z}_2$, $(\mathbb{Z}_4 \times (L : 2_4)).\mathbb{Z}_2$, $(\mathbb{Z}_6 \times (L : 2_5)).\mathbb{Z}_2$, $(\mathbb{Z}_6 \times (L : 2_6)).\mathbb{Z}_2$, $(\mathbb{Z}_6 \times (L : 2_7)).\mathbb{Z}_2$, $\mathbb{Z}_2 \times (L : 2_1)$, $\mathbb{Z}_4 \times (L : 2_2)$, $\mathbb{Z}_4 \times (L : 2_3)$, $\mathbb{Z}_2 \times L$, $(\mathbb{Z}_2 \times \mathbb{Z}_6) \times L$, $D_{12} \times L$, $(\mathbb{Z}_2 \times L).D_6$, $A_4 \times L$, $L.A_4$ or $T \times L$.

Proof. As $|L : D_{12}| = 2^{26}.3^6.5^4.7.13.17^2$ and $\pi_e(L : (D_{12})) = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 20, 21, 24, 26, 30, 34, 39, 40, 42, 45, 48, 51, 60, 63, 65, 68, 85, 102, 126, 130, 170, 255\}$, then $D(L : D_{12}) = (5, 5, 4, 2, 3, 3)$. Since $|G| = |L : D_{12}|$ and $D(G) = D(L : D_{12})$, we conclude that $\Gamma(G)$ has the following form (like $\Gamma(L : D_{12})$):

\[\square\]
Step 1. Let $K$ be the maximal normal solvable subgroup of $G$. Then $K$ is a $\{2, 3\}$-group. In particular, $G$ is non-solvable.

The proof is similar to Step 1 in Proposition 3.5.

Step 2. The quotient $G/K$ is an almost simple group. In fact, $S \leq G/K \leq \text{Aut}(S)$, where $S$ is a finite non-abelian simple group.

To get the proof, follow the way in the proof of Step 2 in Proposition 3.5.

By TABLE 1 and Step 1, it is evident that $|S| = 2^a \cdot 3^2 \cdot 5^4 \cdot 7 \cdot 13 \cdot 17^2$, where $2 \leq a \leq 26$ and $1 \leq \beta \leq 6$. Now, using collected results contained in TABLE 1, we conclude that $S \cong D_4(4)$ and by Step 2, $L \leq G/K \leq \text{Aut}(L)$. As $|G| = |L : D_{12}| = 12|L|$, we deduce $|K| = 1, 2, 3, 4, 6$ or 12.

If $|K| = 1$, then $G \cong L : D_{12}$.

If $|K| = 2$, then $G/K \cong L : (D_6)_1, L : (D_6)_2$ or $L : 6$ and $K \leq Z(G)$. It follows that $G$ is a central extension of $K$ by $L : (D_6)_1, L : (D_6)_2$ or $L : 6$. If $G$ splits over $K$, then $G \cong \mathbb{Z}_2 \times (L : (D_6)_1), \mathbb{Z}_2 \times (L : (D_6)_2)$ or $\mathbb{Z}_2 \times (L : 6)$.

Otherwise $G \cong \mathbb{Z}_2 \times (L : (D_6)_1)$ or $\mathbb{Z}_2 \times (L : (D_6)_2)$.

If $|K| = 3$, then $G/K \cong L : 2^2$. But $G/C_G(K) \leq \text{Aut}(K) \cong \mathbb{Z}_2$. Thus $|G/C_G(K)| = 1$ or 2. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L : 2^2$. If $G$ splits over $K$, then $G \cong \mathbb{Z}_3 \times (L : 2^2)$.

Otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 2^2$, which is impossible. If $|G/C_G(K)| = 2$, then $K < C_G(K)$ and $1 \neq C_G(K)/K \cong G/K \cong L : 2^2$, and we obtain $C_G(K)/K \cong L : 2, L : 2_\text{a}$ or $L : 2_\text{b}$. Since $K \leq Z(C_G(K))$, $C_G(K)$ is a central extension of $K$ by $L : 2_1, L : 2_2$ or $L : 2_3$. Thus $C_G(K) \cong \mathbb{Z}_3 \times (L : 2_1), \mathbb{Z}_3 \times (L : 2_2)$ or $\mathbb{Z}_3 \times (L : 2_3)$, otherwise we get a contradiction because 3 must divide the Schur multiplier of $L : 2_1, L : 2_2$ or $L : 2_3$, which is impossible. Therefore, $G \cong (\mathbb{Z}_3 \times (L : 2_1)), \mathbb{Z}_2, (\mathbb{Z}_3 \times (L : 2_2)), \mathbb{Z}_2$ or $Z_3 \times (L : 2_3)) \mathbb{Z}_2$.

If $|K| = 4$, then $G/K \cong L : 3$ and $K \cong \mathbb{Z}_4$ or $\mathbb{Z}_2 \times \mathbb{Z}_2$. In this case we have $G/C_G(K) \leq \text{Aut}(K) \cong \mathbb{Z}_2$ or $S_3$. Thus $|G/C_G(K)| = 1, 2, 3$ or 6. If $|G/C_G(K)| = 1$, then $K \leq Z(G)$, that is, $G$ is a central extension of $K$ by $L : 3$. If $G$ splits over $K$ by $L : 3$, then $G \cong \mathbb{Z}_4 \times (L : 3)$ or $(\mathbb{Z}_2 \times \mathbb{Z}_2) \times (L : 3)$. Otherwise we get a contradiction because $|K|$ must divide the Schur multiplier of $L : 3$, which is impossible. If $|G/C_G(K)| \neq 1$, since $|G/C_G(K)| = 2, 3$ or 6, it follows that $K < C_G(K)$. As $L$ is simple, we conclude that $1 \neq C_G(K)/K$ must
be an extension of \( L \). Hence \( |G/C_G(K)| = 3 \) and therefore \( C_G(K)/K \cong L \).
Now, since \( K \leq Z(C_G(K)) \), we conclude that \( C_G(K) \) is a central extension of \( K \) by \( L \). Thus \( C_G(K) \cong \mathbb{Z}_4 \times L \), or \((\mathbb{Z}_2 \times \mathbb{Z}_2) \times L\), otherwise \( |K| \) must divide the Schur multiplier of \( L \), which is 1 and it is impossible. Therefore, \( G \cong (\mathbb{Z}_4 \times L) \cdot \mathbb{Z}_3 \) or \((\mathbb{Z}_2 \times \mathbb{Z}_2) \times L) \cdot \mathbb{Z}_3 \).

If \( |K| = 6 \), then \( G/K \cong L : 2 \), \( L : 2 \) or \( L : 2 \) and \( K \cong \mathbb{Z}_6 \) or \( D_6 \). If \( K \cong \mathbb{Z}_6 \), then \( G/C_G(K) \leq \mathbb{Z}_2 \) and so \( |G/C_G(K)| = 1 \) or 2. If \( |G/C_G(K)| = 1 \), then \( K \leq Z(G) \), that is \( G \) is a central extension of \( \mathbb{Z}_6 \) by \( L : 2 \), \( L : 2 \) or \( L : 2 \). If \( G \) splits over \( K \), we obtain \( G \cong \mathbb{Z}_6 \times (L : 2) \), \( \mathbb{Z}_6 \times (L : 2) \) or \( \mathbb{Z}_6 \times (L : 2) \), otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L \), which is 1 and it is impossible. If \( |G/C_G(K)| = 2 \), then \( K < C_G(K) \) and \( 1 \neq C_G(K)/K \leq G/K \cong L : 2 \), \( L : 2 \) or \( L : 2 \), and we obtain \( C_G(K)/K \cong L \). Since \( K \leq Z(C_G(K)) \), \( C_G(K) \) is a central extension of \( K \) by \( L \). Thus \( C_G(K) \cong \mathbb{Z}_6 \times L \), otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L \). Therefore \( G \cong (\mathbb{Z}_6 \times L) \cdot \mathbb{Z}_2 \). If \( K \cong D_6 \), then \( G/C_G(K) \leq D_6 \) and so \( |G/C_G(K)| = 1, 2, 3 \) or 6. If \( |G/C_G(K)| = 1 \), then \( K \leq Z(G) \), that is a contradiction. If \( |G/C_G(K)| = 2 \), then we have \( |K C_G(K)| = 6, |G|/2 = 3|G| \) because \( K \cap C_G(K) = 1 \), which is a contradiction. If \( |G/C_G(K)| = 3 \), then we have \( |K C_G(K)| = 6, |G|/3 = 2|G| \) because \( K \cap C_G(K) = 1 \), which is a contradiction. If \( |G/C_G(K)| = 6 \), then \( G/C_G(K) \cong D_6 \) and \( C_G(K) \neq 1 \). Hence, \( K \cong C_G(K) \cong C_G(K) K/K \leq G/K \cong L : 2, L : 2 \) or \( L : 2 \). It follows that \( C_G(K) \cong L : 2, L : 2 \) or \( L : 2 \) because \( L \) is simple. Therefore, \( G \cong D_6 \times (L : 2) \), \( D_6 \times (L : 2) \) or \( D_6 \times (L : 2) \).

Before processing the last case, we recall the following facts.

There exist five non-isomorphic groups of order 12. Two of them are abelian and three are non-abelian. The non-abelian groups are: alternating group \( A_4 \), dihedral group \( D_{12} \) and the dicyclic group \( T \) with generators \( a \) and \( b \), subject to the relations \( a^6 = 1, a^3 = b^2 \) and \( b^{-1}ab = a^{-1} \).

If \( |K| = 12 \), then \( G/K \cong L \) and \( K \cong \mathbb{Z}_{12}, \mathbb{Z}_2 \times \mathbb{Z}_6, D_{12}, A_4 \) or \( T \). But \( C_G(K) K/K \leq G/K \cong L \). If \( C_G(K) K/K = 1 \), then \( C_G(K) \leq K \) and hence \( |L| = |G/K||G/C_G(K)||\text{Aut}(K)| \). Thus \( |L| |\text{Aut}(K)| \), a contradiction.

Therefore, \( C_G(K)/K \neq 1 \) and since \( L \) is simple group, we conclude that \( G = C_G(K) K \) and hence, \( G/C_G(K) \cong K/Z(K) \). Now, we should consider the following cases:

If \( K \cong \mathbb{Z}_{12} \) or \( \mathbb{Z}_2 \times \mathbb{Z}_6 \), then \( G/C_G(K) = 1 \). Therefore \( K \leq Z(G) \), that is \( G \) is a central extension of \( \mathbb{Z}_{12} \) or \( \mathbb{Z}_2 \times \mathbb{Z}_6 \) by \( L \). If \( G \) splits over \( K \), we obtain \( G \cong \mathbb{Z}_{12} \times L \) or \((\mathbb{Z}_2 \times \mathbb{Z}_6) \times L\), otherwise we get a contradiction because \( |K| \) must divide the Schur multiplier of \( L \), which is 1 and it is impossible.
If $K \cong D_{12}$, then $G = K.L$ and $G/C_G(K) \cong D_6$. Since $C_G(K)/Z(K) \cong G/K \cong L$ and $Z(K) \leq Z(C_G(K))$, we conclude that $C_G(K)$ is a central extension of $Z(K) \cong \mathbb{Z}_2$ by $L$. If $C_G(K)$ is a non-split extension, then 2 must divide the Schur multiplier of $L$, which is 1 and it is impossible. Thus $C_G(K) \cong \mathbb{Z}_2 \times L$ and hence, $G$ is a split extension of $K$ by $L$. Now, since $\text{Hom}(L, \text{Aut}(D_{12}))$ is trivial, we have $G \cong D_{12} \times L$.

If $K \cong A_4$, then $G/C_G(K) \cong A_4$. As $G = C_G(K)K$, It follows that $C_G(K) \cong L$. Therefore $G \cong L \times A_4$ or $L.A_4$.

If $K \cong T$, then By the similar way in case $K \cong D_{12}$, we can conclude that $G$ is a split extension of $K$ by $L$. Also, since $\text{Hom}(L, \text{Aut}(T))$ is trivial, we have $G \cong T \times L$. □

According to what we said before the proof, here we depict $\Gamma(M)$ by $|M|$ and $\pi_e(M)$, where $M$ is an almost simple group related to $L = D_4(4)$.
